**POLITICAL SCIENCE, ACADEMY OF, IN THE CITY OF NEW YORK.** A national institution for advancing the political sciences and promoting their application to public problems; founded in 1880 in New York City, and incorporated in 1910 under the membership corporations law of the State of New York. On Dec. 31, 1926, it had 6206 members, of whom nine were honorary members, 179 life members, and approximately 1000 subscribing members, chiefly libraries and organizations. All States in the Union, the District of Columbia, Porto Rico, Hawaii, the Philippine Islands, and leading foreign countries, are represented in both the individual and subscribing memberships. Two general meetings were held in 1926. The semi-annual meeting, May 10-14, was an international conference held at Briarcliff Manor, N. Y., to discuss international problems and relations. This conference brought together a representative gathering of American editors and journalists, and special foreign guests representing England, France, Germany, and Switzerland. The papers and addresses delivered at the conference were published in the *Proceedings*, July 1, 1926. This volume, which attracted wide attention, contained papers arranged under nine topics, as follows: *Disarmament and Security*; *Raw Materials in Relation to International Peace and Economic Prosperity*; *The Far East*; *The Danubian and Balkan States*; *Economic Adjustment*

and the French Debt; International Problems and Latin America; International Cooperation for the Promotion of Public Health and Social Welfare; special topics, The World Court, Transit Problems, Tariffs and Trade Barriers, Press and Social Safety; America's Part in International Cooperation.

The annual meeting November 17 was devoted to the subject, Business and Public Policy. Three sessions were held on installment purchasing, its merits and demerits; better economic organization of agriculture; problems of prosperity. These papers and addresses were to be published in the *Proceedings* for January, 1927. Another volume of *Proceedings* appeared in January, 1926, and contained the papers and addresses at the annual meeting held in October, 1925, on the subject of trade associations and business combinations. Other publications in 1926 were four issues of the *Political Science Quarterly*, the official organ of the academy, edited by the political science faculty of Columbia University, and including the "Record of Political Events, Jan. 1-Dec. 31, 1925." A total of 1435 pages was the output of the year.

The total income for the year 1926 was about \$35,000, made up chiefly from membership dues. The officers in 1926 were Samuel McCune Lindsay, president; Albert Shaw and Paul M. Warburg, vice-presidents; Parker T. Moon, secretary and managing editor of the publications; George A. Plimpton, treasurer; and Ethel Warner, executive secretary and assistant treasurer. The headquarters are in Fayerweather Hall, Columbia University, New York City.

**POLITICS, INSTITUTE OF.** These annual sessions, at which foreign affairs are so discussed as to promote a more sympathetic understanding of the problems and policies of other nations, were inaugurated by the trustees of Williams College in September, 1919. Courses of public lectures are delivered by scholars and statesmen from foreign countries, and round-table and open conferences, presided over by recognized authorities on the topics selected for discussion, are established. The first session of the institute was held at Williamstown, Mass., in the summer of 1921, and annual sessions have taken place since that time. Membership is open to men and women on the faculties of colleges and universities, to writers on foreign politics, to persons engaged in the direction of foreign commerce or banking, to diplomatic and consular officials, to officers of the army and navy, to editors, foreign correspondents of the press, and by invitation, to others who have had training and experience in international law and politics. In 1924 the General Education Board and the Carnegie Corporation joined with Bernard M. Baruch, who had made the first three meetings possible, in financing the movement for a five-year period.

The sixth session of the institute met in Williamstown, July 29-Aug. 26, 1926, with a membership of about 300. The general subject of the discussions was international relations. Addresses were delivered by visitors of international reputation, among whom were Dr. Alfred E. Zimmermann, commissioner of the League of Nations at Vienna, and Sir Frederick Whyte, president of the Indian legislative assembly, 1920-25. Lecture courses were conducted by Dr. Nicholas Politis, the Greek minister to France,

on Disarmament and Security, and by A. Mendelssohn-Bartholdy, director of the Hamburg Institute of Foreign Politics, on Europe.

Round table conferences were held on a number of political and legal questions, among which may be mentioned: Mineral Resources in Their Political Relations, by Dr. H. Foster Bain, secretary of the American Institute of Mining and Metallurgical Engineers, Dr. Charles K. Leith, University of Wisconsin, and Charles H. MacDowell, president of the Armour Fertilizer Works; New Aspects of the World Economic Situation, by Dr. Moritz J. Bonn, College of Commerce, Berlin; The Role of Chemistry in the World's Future Affairs, by Harrison E. Howe, editor of *Industrial and Engineering Chemistry*; International Problems Arising from the Diversity of Legal Systems, by Arthur K. Kuhn, president of the American branch of the International Law Association; The Chinese Republic and the Powers, by Henry K. Norton, Ossining, N. Y.; Limitation of Armaments, by Dr. Jesse S. Reeves, University of Michigan; Inter-American Problems in the Foreign Policy of the United States, by Dr. Leo S. Rowe, director-general, Pan American Union.

The general conferences included the following subjects: Mineral Resources in Their Political Relations, by Dr. Bain, Dr. Leith, and Mr. MacDowell; A Survey of the International Situation in the Far East, by Dr. George H. Blakeslee, Clark University; Public Opinion in World Affairs, by Arthur S. Draper, foreign editor, *New York Herald-Tribune*; Chemistry in World Affairs, by Harrison E. Howe. The institute publishes an annual *Report* of the main ideas developed at the conferences; copies may be obtained by advance orders through the secretary. The officers of administration in 1926 were Harry Augustus Garfield, chairman; Walter Wallace McLaren, executive secretary, and Willard Evans Hoyt, treasurer. Headquarters are at 1 Hopkins Hall, Williamstown, Mass. See **CHEMISTRY, INDUSTRIAL**.

**POLO.** There were no international polo competitions of importance during 1926, but the sport thrived marvelously, nevertheless, throughout the United States and South American countries and in the British dominions. The Hurricanes proved the most sensational polo combination of the year, winning the United States open championship and various other tourneys. Six men comprised the Hurricane line-up, four belonging to the younger group of American players and two being visiting Englishmen. Stephen Sanford was responsible for the organization of the team, and supporting him were Robert E. Strawbridge, Eric Pedley and Winston Guest, Americans, and Major Vivian Lockett and Captain C. I. T. Roark of England. Because of an injury, Major Lockett was able to take part in only one of the more important matches. The junior championship and the intercircuit honors in the United States were both won by Army fours. Both the outdoor and the indoor intercollegiate titles went to Yale University. It was practically assured that an international match for the Hurlingham trophy would be held during 1927, the possibility being that the British would attempt to regain the cup through an Indian team. A three-cornered tournament by teams representing the United States, Argentina and Great Britain also was favorably considered.

**POPULATION AND FOOD PRODUCTION.** See AGRICULTURE.**PORK.** See LIVESTOCK.**PORTLAND CEMENT.** See CEMENT.

**PORTO RICO**, pòr'tò rēkō. An island possession of the United States in the West Indies; the most easterly and the smallest but most densely populated of the Greater Antilles; lying 480 miles east of Cuba, 1380 miles southeast of New York. Capital, San Juan.

**AREA AND POPULATION.** The area of the island is 3435 square miles. The population, according to the census of 1920, was 1,299,809; in 1926 it was estimated at 1,417,000, of which 388,756, or 27.4 per cent, was urban and 1,026,890, or 72.6 per cent, was rural; 1,088,668, or 76.8 per cent, was white, and 328,978, or 23.2 per cent, was colored. In 1926 the birth rate was 39 per thousand and the death rate 22, and the rate of natural increase 16.9. The number of persons married during the year was 21,348. The capital, San Juan, had a population of 70,707 in 1920. Other important towns of Porto Rico are Ponce (41,561) and Mayaguez (19,069).

**EDUCATION.** Elementary education is free and compulsory between the ages of 8 and 14. The legal school year consists of 10 school months of 20 days each in both urban and rural schools. Night schools are maintained for 32 weeks, and the University of Porto Rico for 36 weeks. In his report covering the year, the Governor of Porto Rico stated that the department of education labored under great embarrassment during that period. The amount made available for expenditures was reduced from \$4,580,000, appropriated the previous year, to \$4,070,000, because of expected reductions in revenues. This necessitated a general reduction of the programme of school extension and an actual reduction of the established activities of the department. The schools of Porto Rico were conducted during the year in 2281 school buildings, representing 4445 different classrooms. Of these, 905 were owned publicly and 1376 were rented. During the year, 25 new buildings were completed in the urban zone and 120 in the rural. Fifty-three buildings were in course of construction, and 62 new sites were acquired. In publicly supported schools there were employed 4478 teachers, of whom 1257 were men and 3221 women. The total enrollment of pupils in the public schools was 213,641. There were 6369 who attended private schools. The number of children of legal school age was 438,743. The number of compulsory school age was 209,220. The high schools numbered 17, employing 209 teachers and having an enrollment of 6159 students. There were 35 continuation schools, employing 62 teachers and having an enrollment of 1100 pupils. The enrollment in all the departments of the University of Porto Rico during 1925-26 was 1270.

**PRODUCTION.** The chief industry on the island is agriculture, and the four principal crops are sugar, tobacco, coffee, and fruits. The sugar crop of the year under review was not as satisfactory as the one of the preceding year. The amount produced during the year was 603,187 tons, and the amount exported was 578,605 tons. The value of the exported crop was \$48,201,000, the average price being 4.17 cents per pound. The low price of sugar was doubtlessly owing to an excess of world production. The tobacco pro-

ducers enjoyed the most prosperous year in the history of the island. Not only was the crop the largest ever produced but it sold for the highest price ever paid for Porto Rican tobacco, with the exception of the "boom year," 1920. The average price paid was about 38 cents per pound, while some lots were sold as high as 46 cents per pound. The crop produced was over 35,000,000 pounds. Exports amounted to 24,521,000 pounds, bringing in New York \$13,944,000, or about 56 cents per pound; while the exports of the previous year amounted to only 22,721,000 pounds, and the amount received was \$9,837,000, or about 43 cents per pound. Cigars exported showed a slight increase, \$7,196,000 in 1925-26 and \$7,105,000 in 1924-25. Coffee producers experienced both an increase of production and an increased value of the product during the year. Exports were 26,330,000 pounds, value, \$7,062,000; average price, 26.8 cents per pound. The total value of fresh and canned fruit exported amounted to \$5,994,000, the highest amount ever received. The amount of cotton produced in Porto Rico during the year was 4,726,000 pounds.

**COMMERCE.** The largest export and import trade of Porto Rico in any normal period was recorded during the fiscal year ending June 30, 1926, when it amounted in value to \$193,983,115, which was an increase of \$8,659,570 over the total for the preceding year and 12 times the value of the 1900 trade. Although the 1925-26 trade was below that of the inflated post-war years, 1919-20 and 1920-21, when the totals were \$247,199,983 and \$217,758,278, respectively, it was nevertheless, the largest figure yet attained under normal conditions. In the fiscal year 1925-26 Porto Rico maintained a favorable trade balance of \$3,466,587, compared with \$4,314,343 for 1924-25. The decrease was merely significant of lower sugar and coffee prices. The accompanying table shows the foreign trade of Porto Rico, by countries:

FOREIGN TRADE OF PORTO RICO FOR FISCAL YEAR 1925-26

Countries	Imports	Exports
	1925-26	1925-26
United States .....	\$83,046,558	\$88,106,570
Dominican Republic .....	1,845,055	1,994,096
British India .....	1,425,077	.....
Spain .....	1,149,020	1,004,339
Dutch West Indies .....	864,564	862,850
Canada .....	853,319	.....
United Kingdom .....	780,029	2,093
Mexico .....	767,226	.....
Newfoundland .....	732,499	.....

Cement .....	561,450	219,268
Newsprint paper .....	32,988	84,029
Corn, grain .....	268,940	7,588

**FINANCE.** The amount of insular revenue during the fiscal year ended June 30, 1926, was \$11,740,364. This was more than 5 per cent in excess of the treasurer's estimate, and more than 38 per cent greater than the revenue of the previous year. The principal increases were in customs, \$445,037; excise taxes, \$1,471,377; and income taxes, \$1,630,966. The net expenses of the operation of the government was \$10,102,934. The insular budget under existing law is prepared in advance for two years and is submitted by the governor to the regular biennial session of the legislature. The budget for the fiscal years ending June 30, 1926 and 1927 was submitted at the regular session of the legislature which convened in February, 1925. The estimates of receipts for each year was placed at \$10,500,000. The governor sent to the legislature the budgets of expenditures, amounting to \$10,283,000, which was \$217,000 below the estimated revenue. The legislature passed budgets amounting to \$10,790,000, or \$290,000 in excess of the estimated revenue. The governor vetoed enough items to reduce the budgets to \$10,417,000, or \$383,000 below the estimated revenue. The bonded debt of the insular government at the close of the fiscal year was \$22,954,000. About \$14,000,000 is for general public improvements, for roads, for schools, and for other public buildings.

**LEGISLATION.** According to the report of Governor Towner, there was a special session of the legislature which met from June 28 to July 14, 1926. Among the legislation enacted were laws amending the University Law; the Internal Revenue Act; the act providing for the incorporation of coöperative associations; the law regulating the operation of motor vehicles, and others of lesser importance. Of the resolutions approved there were some providing for the transfer of public lands to the Federal government; one exempting from taxation the property and shares of coöperative associations organized under the act of 1925; others authorizing the sale of lots to certain religious organizations; and some authorizing the economy commission of the legislature to grant some municipalities certain sums of money out of the premiums obtained in the sale of insular bonds.

**OFFICERS.** The members of the government at the end of the year were: Governor, Horace M. Towner; Attorney-General, George C. Buttee; Treasurer, Juan G. Gallardo; Commissioner of the Interior, Guillermo Esteves; Commissioner of Education, Juan B. Huyke; Commissioner of Agriculture and Labor, Carlos E. Chardon; Com-

missioner of Health, Pedro W. Ortiz; Auditor of Porto Rico, Frederick G. Holcomb; Executive Secretary, Eduardo J. Saldana.

**PORTS AND HARBORS.** Notwithstanding the great increase in the water-borne commerce of the United States, there was comparatively little important work done in development of the ports and harbors and provision of increased facilities during 1926, though new elevators, coal docks, and piers were being built. The general work of deepening waterways continued, and at some ports construction proceeded. In Europe certain developments were undertaken, but in most countries it was not possible to carry on work on the scale originally planned. The accompanying paragraphs indicate some of the more important projects in progress or completed during the year.

**ALABAMA STATE DOCKS.** Work was well under way during the year on a port-development project along the Mobile River, close to Mobile, Ala., which was being undertaken by a State commission. This work involved a 560-acre site, and contemplated the construction of five slips, 1600 feet long by 350 feet wide, with piers 516 feet wide between the slips, transit sheds, a cotton warehouse, and a railway yard. Construction work to cost \$10,000,000 was authorized, and up to the end of the year \$5,000,000 bonds had been sold. The work accomplished included the removal of the Louisville and Nashville R. R. main line inland clear of the site, the opening of a new canal for industries which were isolated by closing the one-mile creek, and miscellaneous construction work, including the completion of a reinforced concrete and steel warehouse for cotton, the completion of the apron wharf for pier Number 2, a reinforced-concrete superstructure carried on concrete piles, and a beginning of work on the apron wharf for pier Number 1. In the river considerable dredging had been done, and preparations were made for awarding the contracts for the transit shed adjacent to the cotton warehouse, and, on pier Number 2, for the buildings of reinforced concrete and steel. The cotton warehouse was placed in service.

**ALBANY PORT DEVELOPMENT.** A Port District Commission comprising the cities of Albany and Rensselaer, N. Y., had put under way for development a project to supply a marine terminal for deep-draft ocean-going vessels on the Hudson River, at Albany. This was in coöperation with the work of the Federal Government in dredging a 30-foot channel as far as Albany at an estimated cost of \$11,200,000. The work on the new terminal began in April, 1926, and it was expected that 300 feet of bulkhead, equipped with cranes, and with a river depth sufficient for vessels of 14-foot draft, would be ready by July, 1927, and 1000 feet of bulkhead storage space and railroad connection by September.

**ORE DOCKS ON THE GREAT LAKES.** At Superior, Wis., ore-shipping docks of both the Northern Pacific Railway and the Great Northern Railway were being reconstructed during the year, and engineers of the two companies had adopted radically different designs for similar structures built at the same place and for the same purpose. The Northern Pacific Railway employed an all-concrete design, including both poured and pre-cast portions. An extension of 648 feet was added to the original dock or pier 1212 feet in length, with 202 pockets of 350 tons

capacity, giving a storage of 70,700 tons. As this dock was inadequate for the increased traffic the extension was added in 1925-6, supplying 108 pockets and increasing the total of storage capacity to 108,500 tons. This dock was 80 feet from water level to base of rail, and 42 feet 4 inches to the low point of the pockets. It was 59 feet wide over the pockets and about 66 feet over the deck. Both the original and the new extension were built entirely of reinforced concrete, mainly poured in place, and an efficient equipment and organization was planned to carry on the work.

The Great Northern Railway, for its ore docks, adopted structural-steel framing, in combination with poured and pre-cast concrete, claiming that greater facility of erection was secured, with lower first cost and a reduction of about 10 per cent in weight above the foundation piling. The substructure of this dock, as in the case of the Northern Pacific dock, was a concrete pier, but instead of using sand-filled cribs with interior piling, the Great Northern dock employed piling alone. In the Great Northern structure concrete columns on a concrete pier carried transverse steel A-frames with steel deck stringers, and framed between them were the steel beams and girders for the front walls and bin bottoms, which were composed of pre-cast concrete slabs. This dock was built originally in 1906-7 as a timber structure 2244 feet in length, with 374 pockets or bins of 300 tons capacity, giving a total storage of 112,200 gross tons. The new dock, when rebuilt, would have a storage capacity of 130,999 gross tons, the pocket capacity being increased to 350 tons. The height of the new dock is 80 feet, 8 inches from water level to base of rail and 42 feet, 4 inches to the low point of the bins or tops of concrete columns. The superstructure has a width of 56 feet over the bin walls and 74 feet between hand rails.

CANADA. Montreal maintained its position of exporting the largest quantity of grain of any seaport of the world, notwithstanding the fact that navigation is closed for five months of the year. In 1925, over 166,000,000 bushels were shipped, and here as at other Canadian ports the grain storage and shipping facilities were being extended. At North Vancouver an elevator with 2,250,000 bushels capacity was being built, and at Prince Rupert another with a capacity of 1,000,000 bushels was completed; while a similar installation was under construction at Victoria. At the latter place the new dry dock at Esquimalt was completed during the year and was put in use, this giving the Dominion of Canada three dry docks with a length of 1000 feet and over.

One of the notable works on the Pacific Coast was the concrete pile pier, 1200 feet long and 331 feet wide, completed during the year by the Canadian Pacific Railway at Vancouver. This pier was designed to accommodate transoceanic ships, and was a combination of earlier plans for two separate piers which were designed to be built between two existing piers of creosoted-pile construction. For this pier, pre-cast concrete piles were used, varying from 15 to 23 inches square in section and from 20 to 73 feet in length, some 6000 piles being required, about half of which were driven with a skid-driver and the remainder by a floating driver. The pier carried two single-deck sheds

from the head-house at the shore end the full length of the pier, these sheds being 109 feet wide and lying on either side of a central depressed area carrying four tracks, over which no roof was provided. The head-house was two stories high, providing on the lower floor storage space and driveways, and on the upper floor passenger and office facilities for the Canadian Pacific ocean steamship service.

GREAT BRITAIN. In Great Britain during the year there was comparatively little activity in the development of dock and harbor undertakings, and the coal strike also tended to suppress any discussion of new projects. The Port of London Authority placed a contract for the enlargement of the Tilbury Docks so that facilities would be provided for the largest vessels afloat. The estimated cost of the new scheme was about £2,750,000, and it was expected that the work would require nearly five years. There was involved a new entrance to the dock, with a length of 1000 feet and a clear width of 110 feet, and with a depth of 45 feet 6 inches over the sill at high water. A new dry dock, having an entrance from the existing wet dock, was to be built, with a length of 750 feet, which later could be increased to 1000 feet if necessary. This dry dock would be 110 feet wide at the entrance, with a depth of 37 feet 6 inches over the sill. A floating passenger landing stage and a new riverside station were to be provided at Tilbury, and the contract was let for the new entrance to the South-West India Dry Dock with a length of 550 feet, a width of 80 feet, and a depth of 35 feet at high water. Various passages were to be constructed, to enable the largest vessels navigating up to this part of the river to proceed to any part of the India and Millwall docks system. Extensions were completed at the Surrey Commercial Dock, and at the Royal Victoria Docks improvements which had been begun in 1924 were completed. In connection with these increased facilities, it may be said that the trade of the Port of London in the financial year 1925-26 exceeded 47,000,000 tons, or an increase of nearly 2,000,000 tons over the preceding year. In addition to work on the docks, considerable dredging, aggregating 4,000,000 cu. yd. of material, was done in the Thames, and the Yantlet Channel was deepened to 30 feet.

Notwithstanding a reduction in the tonnage using the Port of Liverpool, as indicated in the report of the Mersey Docks and Harbor Board, improvements were in progress, and the Gladstone Dock extension, begun in 1910, had reached a stage where sheds and cranes on the dock site were being erected. The capital expenditure of this work had averaged about £1,000,000 annually. At the Alfred Docks, Birkenhead, the new 80-foot lock entrance as well as the 80-foot inner passage was under construction, with appropriate steel gates. A new passage 100 feet wide, with a depth of water of 31 feet, between the West Float and Wallasey Pool, Birkenhead, was also under construction. The Manchester Ship Canal had been deepened to 30 feet, between Eastham and Stanlow oil docks, and various extensions were in progress at other docks. At Seacombe a new floating roadway and landing stage was dedicated, and on the Cheshire bank of the River Mersey the new Bromborough Dock was under way.

At Southampton, the Southern Railway Com-

pany had revised its scheme for the extension of the Southampton Docks, and was developing a project estimated to cost when completed about £13,000,000, and to provide 16,600 feet of additional quays, and accommodation for 20 of the world's largest liners. During the year, the berths for the 60,000-ton floating dock which had been moored in Southampton harbor dock had to be redredged and the dock temporarily moved. The approach channel from Calshot to the Southampton dock entrance was dredged so as to afford a depth of 35 feet at low water.

Other improvements in England were generally discussed, but not much work was under way.

**FRANCE.** The opening of the Rove Tunnel in October (see CANALS) was the principal achievement of the year, and it was expected that it would be of great importance to the port of Marseilles, providing additional quay accommodation in the Étang de Berre and opening up the port to barge traffic on the Rhône. At Havre, the large dry dock under construction since 1911 had not been finished, but it was hoped that it would be opened in 1927. This dock was built in and upon a huge steel caisson framework which was floated into position over a site previously dredged to the required depth, and was there sunk in place.

**ITALY.** In Italy, during the year, extensive quays were being built at Genoa, Naples, Catania and Palermo; concrete-block construction on rubble bases being employed for this type of work. New quays were being built at Leghorn and Venice, where monolith construction was employed, as the foundations had to be sunk through a considerable depth of soft ground. At Venice, a new commercial port on the mainland at Marghera had been built, and the first section of the entrance channel up from the Lido was well under way and would be completed in 1927, it was expected. This provided for a depth of 11 meters and a width of 150 meters.

**BELGIUM.** At Antwerp, steady progress was being made in the important dock extensions, and in addition to the building of the Kruisschans lock the *bassin-canal* between the lock and the old docks was nearing completion. This link was to be 5 kilometers long, with a minimum width of 300 meters. Antwerp was spending over \$10,000,000 on its various port improvements, but the commerce of the port, which before the War averaged about 14,000,000 tons annually, in 1925 totaled over 20,000,000 tons.

**HOLLAND.** Progress was recorded on the construction of the new lock at Ymuiden, which was to be one of the largest in the world and was to be completed in 1928. It was announced that the ship canal between Ymuiden and Amsterdam would be commenced in 1927, while the waterway from the German Rhine to Rotterdam was under improvement, being one of the most important public works of the Dutch Government for some time. The River Noord was being widened throughout its length to 200 meters. The Dutch Government also had under way the improvement of the Dordrecht and North Sea Canal, and the construction of a new waterway from the River Waal at Nimeguen to the River Maas. The new port of Basle on the Rhine was opened during the summer, and there was in operation a direct barge service between that point and Rotterdam.

**SPAIN.** At Valencia, a new northern break-

water and eastern wharf was under construction, as well as harbor work at Bilbao, Huelva, and Barcelona.

**SOUTH AMERICA.** At the port of Valparaíso, the seaward extension of the breakwater was continued, being a notable work with the outer end having its foundation at a depth of 140 feet below sea level. This was said to be a greater depth of water for harbor construction than was found in any similar work. A new breakwater was practically completed at Antofagasta during the year; it was built in an average depth of water of over 80 feet, and was of concrete-block construction, placed on a rubble mound, at a depth of about 32 feet. At this port the scheme of construction in progress was estimated to involve over \$15,000,000. Valdivia, a Chilean river port, was the scene of considerable dredging, which, with other works, was to cost over \$5,000,000; while harbor work was under way at Constitución. In Peru, port improvements were being constructed at Callao. At Buenos Aires the Argentine Government had decided upon some harbor extensions that had been suspended. At Rio de Janeiro, the anchorage was being deepened to 10 meters, and an addition of 1025 meters was being made to the deep-water quays. Port extension works were begun at Santos, the work being estimated to require some eight to 10 years for its completion.

**AFRICA.** Progress was recorded in the development of Table Bay harbor and at Port Elizabeth, while at Walfish Bay a new basin and wharf were completed during the year, providing a depth of 30 feet throughout the entrance channel and of 33 feet alongside the wharf at low water. In Northern Africa, the Mustapha basin at Algiers, begun in 1923, and the new jetty, 5000 feet in length, showed progress. For the former, superimposed concrete blocks were used for the walls; the largest blocks weighed as much as 400 tons. The jetty was of the vertical wall type, on a rubble base. At Bizerta, in Tunis, damage to the mole done in 1915 was being remedied by the reconstruction of over 600 feet. At Casablanca, in French Morocco, was completed during the year the great outer breakwater, 2100 meters in length, together with some new quays.

**FAR EAST.** The new King George Dock at Calcutta progressed actively during the year, so that it was estimated that the opening would take place in 1928. This would add nearly 200 acres of water space to the Calcutta dock system, along with adequate equipment for cargo handling on the dock sides in the way of electric cranes. At Bombay, the construction of very large new docks at Trombay in the upper part of the harbor, at the Island of Elephanta, was under construction; while reclamation work in the back bay was in progress, but having involved expenditures in excess of the estimates, was the subject of an official inquiry. At Singapore, active work was under way in connection with the new naval base, with large-scale dredging and some structural work. A floating dock, 850 feet in length by 170 feet in width, with a lifting capacity of 50,000 tons, was put under contract. At Basra, a new channel was dredged through the bar at the mouth of the Shatt-al-Arab, and was completed in April, affording access to Basra for vessels drawing 24 feet. It was proposed to increase this depth to permit

ships drawing 30 feet to pass. The project was being executed by suction dredges.

**AUSTRALASIA.** In Australia, the Appleton Docks extension at Melbourne was proceeding rapidly, and the existing channels of the harbor were being extended. At Coff's Harbor, on the eastern coast of New South Wales, a new port was being constructed, involving the construction of two breakwaters which would provide a sheltered archway of 100 acres with a depth in excess of 30 feet. In Western Australia, at Fremantle, the Victoria Quay was being reconstructed, and at Albany the harbor was being dredged to a depth of 33 feet. The Federal Parliament in Australia was considering schemes to develop port sites in the Northern Territory.

**PORTUGAL.** A republic of Europe, situated west of Spain in the Iberian peninsula, the westernmost of all the states of Europe. Capital, Lisbon.

**AREA AND POPULATION.** The area of continental Portugal is 34,254 square miles; population, according to the census of 1920, 5,621,977, as compared with 5,545,595 in 1911. The Azores, with an area of 922 square miles, had a population of 242,613 in 1920; and Madeira, with an area of 314 square miles, a population of 169,777 in 1920. The total area, therefore may be considered 35,490 square miles and the population in 1920 may be placed at 6,032,991, because the Azores and Madeira are considered integral parts of the republic. The Portuguese colonial possessions in Africa and Asia had an estimated area of 936,264 square miles, with a population of 8,737,853, of which 927,292 square miles, with a population of 7,736,700, were in Africa. Lisbon, the capital, had a population in 1920 of 486,372, and Oporto, the next largest city, 203,091. No later educational statistics are available than those for 1919, when the public elementary schools numbered 7007, with 170,415 pupils. According to the 1920 census, the illiterates numbered 1,838,419 men and 2,438,992 women.

**PRODUCTION.** About one-third of the surface of Portugal is under cultivation; the greater part is used for cereals, pulse, pasture, etc. Corn, rye, and wheat are the chief cereals. See Table of Production by Countries under article **AGRICULTURE**. The livestock raised are largely sheep, goats, oxen, and swine. An extensive acreage is planted in vineyards, wine being one of the chief products of the country. The growing of olives, figs, and oranges is of some importance also. Forests cover about 17 per cent of the total area; the annual yield of cork has been estimated at more than 175,000,000 pounds. The most valuable mineral resource is wolfram; others are antimony, copper, gold, iron, lead, tin, and manganese; but the deposits are not developed to any considerable extent, for lack of fuel and cheap transportation facilities.

**COMMERCE.** Complete returns for Portuguese commerce in 1925 were not available, but the combined exports from Portugal and its near-by islands to the United States showed a total of \$5,297,672 against \$6,125,499 in 1924. The decrease was entirely due to the decline in exports from the Azores and Madeira Islands, since shipments increased from both Lisbon and Oporto, on the mainland. Exports declared from Madeira, owing to reduced demands for embroideries, showed a striking decline from \$2,858,440 in 1924 to \$1,306,687 in 1925. Shipments from the Azores, for a similar reason, declined from

\$324,336 to \$126,291. Cork products constituted the most important single class of goods imported from the mainland; these, as declared through Lisbon, aggregated \$1,701,754 as against \$1,054,619 in 1924. Unfavorable conditions prevailing in the fishing industry in 1925 reduced shipments of sardines packed in oil to \$835,832, from \$1,063,304 in the earlier year. The trade in dried figs assumed more than usual importance, with a value of \$344,436 in 1925 as against \$152,642 in 1924. Goat and kid skins rose to \$135,320 from \$9926. The only notable item to show a value decline in 1925, aside from sardines, was cocoa beans, which dropped from \$184,733 to \$145,296. In 1924 the total imports were valued at 2,832,270,512 escudos and the total exports at 924,973,975 escudos.

**FINANCE.** The estimated revenue and expenditure for 1923-24 was 674,076,163 escudos and 813,402,000 escudos; for 1924-25, 1,237,986,167 escudos and 1,324,188,853 escudos; for 1925-26, 1,306,193,612 and 1,369,758,749; for 1926-27, 1,314,377,491 and 1,397,534,483. In the last month of 1926 *Commerce Reports* published corrected figures concerning the 1924-25 budget, which showed that the expenditures of the government for the year exceeded the country's collected revenue by the sum of \$8,390,000 (gold). The deficit was covered by borrowing.

**COMMUNICATIONS.** No later figures were available than those given in the preceding *YEAR BOOK*, which showed that in 1923, 2446 vessels of 4,865,880 tons entered the port of Lisbon. At the beginning of 1924 the total railroad mileage was 2040, of which 843 was state-owned.

**GOVERNMENT.** Executive power is vested in the president, elected by the parliament for four years but ineligible for reelection, who acts through a responsible ministry; and legislative power in a parliament of two chambers, the upper house having 71 members elected by the municipal councils, and the lower house 164 members elected for three years by direct suffrage. President of the republic at the beginning of the year, Bernardino Machado, elected Dec. 12, 1925. After the elections of Nov. 8, 1925, the Senate had 41 Democrats, 9 Nationals, and 20 others; and the Chamber of Deputies had 84 Democrats, 23 Nationalists, and 53 others. The cabinet, which was formed on Dec. 18, 1925, consisted of the following members: Premier and Minister of the Interior, Antonio M. Silva; Foreign Affairs, Dr. Vasco Borges; Finance, Armando M. Guedes; Justice, Dr. Catanho de Menezes; War, Col. José de Mascarenhas; Marine, Commander Pereira da Silva; Colonies, Gen. Viera da Rocha; Instruction, Dr. Santos Silva; Commerce, Dr. Jaspas de Lemos; Agriculture, Dr. Torres Garcia.

**HISTORY.** Portugal suffered from its usual share of revolutions in 1926. In February an attempt, under the leadership of some of the military officers, was made to overthrow the government, but it was quashed by the decisive action of the ministers of marine and foreign affairs, the more easily when the expected support of the revolutionists failed to materialize. After a period of comparative quiet, the revolutionary movement broke out anew in May, and on the 29th a bloodless revolution succeeded in overthrowing the Da Silva ministry. President Machado resigned June 1, and the control of the government was taken over by General Gomes da Costa, who assumed the ministerial positions

of war, colonies, and agriculture. The revolutionists declared that they merely wished to set up a more democratic form of government and rid the country of professional politicians. Apparently at the beginning, at least, the new government had the united support of almost all the factions in the country. After a brief attempt at rule by a triumvirate, General da Costa entered Lisbon at the head of the army, and June 27 made himself the supreme dictator of the affairs of the country. His rule did not last long, however, inasmuch as he was arrested July 9 by General Carmona, who had been dismissed from office by da Costa, and another bloodless revolution then occurred which left General Carmona in the saddle. The latter proceeded to appoint a cabinet, with himself as premier and minister of war. General da Costa was exiled by the new ruler. On November 29, General Carmona assumed the post of president of the republic, and appeared to have established his government on a firm basis, through amnesty to former enemies, including da Costa, and through a desire really to bring about reforms, mostly financial, which would restore the country to a firm economic basis. As the year closed there was considerable speculation as to whether parliament would peacefully accept General Carmona's assumption of the presidency of the republic, an office which could be constitutionally obtained by parliamentary election only.

**PORTUGUESE EAST AFRICA**, or **MOZAMBIQUE**. A colony of Portugal, extending along the coast of Africa from 10° 40' S. latitude to the boundary of the Union of South Africa; bounded on the west by the Union of South Africa and Rhodesia, and on the north by Tanganyika. Area, 428,132 square miles. The estimated population comprises about 3,000,000 natives; 10,500 whites; and 1100 Asiatics and half-castes. There are three clearly defined divisions of the colony: (1) the Province of Mozambique, 295,000 square miles; (2) the territory under the Mozambique Company, 59,840 square miles; (3) the district under the Nyasa Company, 73,292 square miles.

In addition, there is the "Kionga Triangle," formerly belonging to German East Africa, situated south of Rovuma, which was allotted to Portugal by the Treaty of Versailles. Lourenço Marques, the capital and chief port for foreign trade, had a population, according to the latest available statistics, of 9849, of whom 4691 were Europeans. Other ports are Mozambique, with a population of about 361,839 (472 Europeans); Ibo, Chinde, Beira, Quilimane, and Inhambane. The chief products are beeswax, coconuts, sugar, and mineral products. Rubber and ivory are exported. The foreign trade of Mozambique Province for 1925 (exclusive of that for the territories of the chartered companies) exceeded the previous year in both imports and exports; but imports so greatly predominated as to increase the very unfavorable balance of trade of 1924. Imports, exclusive of gold and silver, amounted to \$13,484,000 and exports to \$7,270,000, leaving a negative balance of \$6,214,000. Corresponding figures for 1924 were \$9,859,000 for imports and \$6,446,000 for exports, with a negative balance of \$3,413,000. In other words, exports in 1925 were only 54 per cent of imports, whereas in 1924 they were 65 per cent. Revenue and expenditure for 1924-25 for the province were estimated at 59,030,386 escudos.

**PORTUGUESE GUINEA**, gin'ê. A colony of Portugal on the west coast of Africa, entirely surrounded on the land side by French territory. It includes the archipelago of Bijagoz, together with the island of Bolama on which is situated the capital, Bolama. Area, estimated at 13,940 square miles; population, variously estimated from 300,000 to 800,000. The principal port is Bissau. The chief products are wax, rubber, ivory, hides, and oil seeds. The imports in 1924 were valued at 61,570,808 escudos; exports at 49,192,929 escudos. The estimated public revenue for the same year was 17,519,538 escudos and the expenditure, 17,505,454 escudos.

**POST OFFICE**. See **UNITED STATES**.

**POTASH**. The United States, in the fertilizer year ended July 1, 1926, used more potash than in any other year on record. (See **FERTILIZERS**.) There was considerable activity in finding new sources of this material, as Congress had appropriated \$100,000 annually for five years for potash prospecting through core drilling, the work being done by the U. S. Geological Survey in coöperation with the U. S. Bureau of Mines. The Texas-New Mexico field was the first to be considered and after favorable preliminary work it was planned to undertake extensive explorations and investigations. During the year the prices of potash were increased, largely on account of higher ocean freights, but the prices in 1926 of the various salts, in comparison with prices in 1914, show that all except one grade, namely kainite, were selling below the pre-war prices. The imports of potash-bearing fertilizers in 1926 were as follows: Muriate of potash, 199,191 tons, valued at \$6,195,830, as against 161,028 tons, valued at \$5,193,866; potash sulphate, 69,873 tons, valued at \$2,826,438, as compared with 68,952 tons, valued at \$2,686,408, in 1925; kainite, 181,877 tons, valued at \$1,225,166, as against 182,828 tons, valued at \$1,173,125, in 1925; manure salts, 316,440 tons, valued at \$3,391,100, as against 384,232 tons, valued at \$3,676,620 in 1925. Other potash-bearing substances aggregated 48,333 tons, valued at \$497,545, as against 23,597 tons, valued at \$320,889, in 1925. The Russian Government reported the finding of large deposits of potash along the Kama River, in the Ural district, which could be exploited more cheaply than the material in Germany or France. Spain, during the year, exported to the United States, as did Italy, while Poland possessed deposits though lacking in the means to develop them. In the United States the American Potash and Chemical Corporation produced 21,000 tons of  $K_2O$  as 96 per cent  $KCl$ . In 1925, according to the U. S. Bureau of Mines, nine plants produced and sold potash in the United States, the crude potash amounting to 51,565 short tons and the available content of potash ( $K_2O$ ) to 25,448 tons, these amounts practically representing the sales, valued at the plants at \$1,204,024. See **CHEMISTRY, INDUSTRIAL**.

**POTATOES**. Data published by the International Institute of Agriculture, Rome, based on production estimates received from 20 countries in the northern hemisphere, not including the Soviet republics, indicated a reduction in yield

16.5 per cent below the corresponding figures in 1925, 6 per cent below the five-year average from 1920 to 1924, and 12.6 per cent less than the pre-war average. Heavy summer rainfall, followed by a prolonged drought, decreased the European production by nearly 735,000,000 bushels as compared with the preceding year. The yields reported for the more important potato-producing countries were as follows, in bushels: Germany, 1,131,665,800; Poland, 905,272,800; Czecho-Slovakia, 233,829,900; Belgium, 105,820,100; England and Wales, 100,128,000; Netherlands, 99,206,400; and Canada, 72,453,500. France for 1925 reported a yield of 558,312,800 bushels and the Soviet Republics of 1,627,000,500. The United States, as estimated by the U. S. Department of Agriculture, produced in 1926, 357,800,000 bushels on 3,163,000 acres or at the rate of 113.1 per acre, as compared with 323,415,000 bushels on 3,092,000 acres or at the rate of 104.6 per acre. The average farm price on Dec. 1, 1926, was \$1.416 per bushel as against \$1.868 in 1925 and 62.5 cents in 1924. At these prices the total value of the crops for the three years was \$506,721,000, \$604,076,000, and \$263,312,000, respectively.

The leading potato-growing States and their yields were as follows, in bushels: Maine, 36,830,000; Michigan, 31,320,000; Minnesota, 29,800,000; New York, 29,016,000; Wisconsin, 27,140,000; and Pennsylvania, 22,176,000. Of these States, Minnesota had the largest and Maine the smallest acreage. The average farm price on Dec. 1, 1926, in the different States ranged from 95 cents per bushel in Washington to \$2.50 in Florida. In the year ended June 30, 1926, the United States exported 1,824,000 bushels and in the preceding fiscal year 3,653,000. The imports for the two years were 325,207,000 pounds and 28,653,000 pounds, respectively. The early potato acreage in Alabama, Florida, Louisiana, South Carolina, and Texas was reported at 80,640 acres as compared with 72,060 harvested in 1925. In ten States growing the early crop, including Virginia, usually planting over 90,000 acres, the total estimated area was 217,570 acres. Much of the crop in Florida and Texas was planted after February 15, which is considered late. The certified seed-potato production, due to low potato prices, dropped from the record crop of 7,372,800 bushels in 1924 to 3,744,360 in 1925. Of the 19 States reporting, Maine ranked first with over 5,000,000 bushels in 1924 and more than 1,750,000 in 1925.

After storing three cars of certified seed experimentally in New Orleans last year, the Louisiana Farm Bureau Federation purchased for its members 65 cars of such seed in the fall of 1926 for storage at Southern points, in readiness for planting in February, when shipments from northern States are made at the risk of freezing. Market potatoes inspected the past year by the Federal-State inspection service in Louisiana at an average cost of \$5.12 per car sold for cash on track at an advance of as much as \$125 per car over similar but uninspected stock. A record production of 1023½ bushels on one acre was unofficially reported as having been obtained on McDonald Island in the delta section of northern California.

**POTTER, WILLIAM.** American diplomat and at one time minister to Italy, died Apr. 29, at Philadelphia, Pa. He was born at Philadelphia, in 1852, and was educated at private

schools and the University of Pennsylvania. For several years he practiced law, and in 1890, President Harrison appointed him a special commissioner of the Post Office and State Departments, to investigate a system of international marine post offices. One of the chief results of Mr. Potter's activities in this connection is seen in the present system of transatlantic mail distribution. In 1892 he was appointed minister to Italy, and he served until 1894. Under President McKinley he was offered the ambassadorship to Germany, but he declined it. From 1917 to 1919 he was the Federal fuel administrator for Pennsylvania. Mr. Potter had many activities in Philadelphia, being particularly concerned with the Jefferson Medical College, of which institution he was chairman of the board of trustees.

**POULTRY DISEASES.** See VETERINARY MEDICINE.

**PRAGMATISM.** See PHILOSOPHY.

**PRAIRIE PROVINCES.** The name applied to the three Canadian provinces of Manitoba, Saskatchewan, and Alberta. Total area, 758,817 square miles (Manitoba, 251,832; Saskatchewan, 251,700; Alberta, 255,285). Population, according to the census of 1921, 1,956,152 (Manitoba, 610,188; Saskatchewan, 757,510; Alberta, 588,454). For production, etc., consult the articles on the respective provinces.

**PRATT INSTITUTE.** A non-sectarian educational institution, at Brooklyn, N. Y.; founded in 1887, and composed of four schools: Fine and applied arts, household science and arts, science and technology, library science. The 1926 fall enrollment was 4262, divided as follows: Arts, 1498; household science, 876; science, 1861; library school, 27. There were 175 members on the faculty, and 79 special lecturers. The library contained 140,000 volumes. President, Frederic B. Pratt.

**PRESBYTERIAN CHURCH.** The Presbyterian Church, with the Reformed Churches, rests on features of the Reformation brought forward by Zwingli and Calvin. It consists of bodies in the United States, the British Isles, and elsewhere, following the doctrinal and ecclesiastical system developed in Holland and France and more fully in Scotland under John Knox. The distinctively Presbyterian bodies of the United States are derived for the most part from bodies in Great Britain, but are in many respects similar to the Reformed churches in the United States, sprung from parent bodies in other parts of Europe, and particularly in Holland. The following organizations in the United States bear the Presbyterian name: Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Cumberland Presbyterian Church; United Presbyterian Church; Colored Cumberland Presbyterian Church; Reformed Presbyterian Church, General Synod; and Associate Synod of North America, also known as the Associate Presbyterian Church. The Presbyterian churches of the United States are affiliated in general with the Alliance of Reformed Churches Throughout the World, an organization to carry on international activities in which the members take a common interest; and with the General Council of the Presbyterian and Reformed Churches in America, a similar organization of purely American scope.

Steps were taken at a meeting of the American section of the World Alliance at Richmond in 1925 to effect a union of the world and American bodies.

**PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA.** This is the largest body of the denomination, and is nationally organized in every State of the Union, with official mission stations in Alaska, Cuba, Porto Rico, and foreign lands. It comprised, in 1926, 46 Synods and 299 presbyteries. The annual General Assembly met in 1926 in Baltimore, Md., May 27-June 2. Statistics for the current year show that there were 9990 ministers, 48,416 elders, 20,498 deacons. Churches numbered 9565 and communicants 1,909,111, an increase of 35,252 over 1925. Sunday-school membership totaled 1,580,780, a decrease of 15,479. The amount of \$61,186,722 was contributed for all purposes, of which \$5,143,129 was devoted to national missionary work, \$4,069,695 to foreign missionary work, \$2,251,482 to Christian education, and \$44,731,062 to congregational expenses. The denomination maintains 56 colleges and 13 theological seminaries. The official medium of the denomination is *The Presbyterian Magazine* (monthly). Privately owned Presbyterian periodicals are *The Presbyterian Advance*, *The Presbyterian Banner*, and *The Presbyterian* (all weekly). The Rev. William Oxley Thompson, D.D., LL.D., president emeritus of Ohio State University, was moderator of the General Assembly in 1926-27. The chief permanent officer is the Stated Clerk, who in 1926 was the Rev. Lewis S. Mudge, D.D., LL.D., 518 Witherspoon Bldg., Philadelphia, Pa.

**PRESBYTERIAN CHURCH IN THE UNITED STATES (SOUTH).** This division of the Presbyterian denomination covers the territory commonly known as the Southern States. It was composed in 1926 of 17 Synods and 91 Presbyteries, with 3601 organized churches and 2235 ministers. The ruling elders numbered 15,323, and deacons 16,521. The total church membership was 462,177. The Sunday school enrollment was 417,569. The contributions for the year were: Current expenses \$9,737,804, a gift of \$20.87 per capita; and benevolences, \$5,477,626, a gift of \$12.04 per capita, making the total gift per member \$32.91. This church had sent out and was supporting 516 missionaries in six districts, Africa, Brazil, China, Japan, Korea, and Mexico. These missionaries were assisted by 3278 native workers. In these six countries there were 48,455 church members and 61,866 members of Sunday schools. The office of the General Assembly and Bureau of Vacancy and Supply is located in Dallas, Tex. The Rev. J. D. Leslie, D.D., LL.D., was Stated Clerk and Treasurer.

**PRESBYTERIAN CHURCH OF NORTH AMERICA, UNITED.** A branch of the Presbyterian Church formed by the union in Pittsburgh in 1858 of the greater part of the Associate Synod (Secession) and the Associate Reformed Synod (Secession and Covenanters). It represents the earlier covenanters and secession movements of the denomination in Scotland, and inherited from them whatever was distinctive in the views and usages of the two branches. In organization and government it is in accord with other Presbyterian bodies, having the same courts—session, presbytery, synod, and general assembly—and observing the same general methods of baptism, admission to church membership, and ordination to the ministry. The General Assembly con-

vened in Sharon, Pa., May 26, 1926. On that date there were 13 synods, 58 presbyteries, 911 congregations, 966 ministers, 4937 ruling elders, and a church membership of 170,650 in the United States. The total membership, including missionary fields, was 227,125. The Sabbath School enrollment was 180,574; there were 1056 young people's societies, with a membership of 31,838; and 1737 missionary societies. The average pastor's salary was \$2266; congregational expenses \$4,388,493; total contributions \$7,049,275, an average per member of \$41.30; missionary contributions \$2,311,788, average per member \$13.54. During the year, new houses of worship were erected at a cost of \$1,472,986. Six colleges and two theological seminaries are maintained by the church, and in 1926 there were 118 theological students. The total contributions of the New World Movement, completed Apr. 1, 1926, were \$7,916,976. During this period there was an increase of 123 foreign missionaries sent into the field. The official organ of the Church is the *United Presbyterian*, a weekly, published at Pittsburgh, Pa. R. A. Hutchinson, D.D., Pittsburgh, was the Moderator of the General Assembly and D. F. McGill, D.D., Bellevue, Pa., was Stated Clerk.

**PRINCE EDWARD ISLAND.** A Maritime Province of Canada; the smallest province in the Dominion, situated at the mouth of the Gulf of St. Lawrence and separated by Northumberland Strait from the mainland of New Brunswick and Nova Scotia. Area, 2184 square miles; population, according to the census of 1921, 88,615. The capital is Charlottetown, with a population of 12,347. The chief industries are agriculture, stock raising, fishing and the breeding of silver foxes. For particulars of agriculture and livestock, see under CANADA. The value of pelts marketed and live foxes sold for breeding purposes in 1925 was estimated at \$3,000,000. The fishing season of 1925 showed a considerable falling off from that of the preceding year, notably in lobsters. The revenue for 1924 was \$676,004 and the expenditure \$699,160. The public debt on Dec. 31, 1924, was \$1,951,663, from which should be subtracted \$775,791 standing to the credit of the province at Ottawa. The province is under a lieutenant-governor and a legislative assembly of 30 members, elected for four years, a property qualification being required in the case of one-half the members and the other half being elected by universal male and female suffrage. Lieutenant-governor, Frank R. Heartz; Premier and Attorney-General, J. D. Stewart; Secretary-Treasurer and Minister of Agriculture, J. H. Myers; Public Works, J. A. Macdonald; Ministers Without Portfolio, J. W. P. McMillan, Murdock Kennedy, Adrian Arsenault, James A. McNeil, and Leonard Wood.

**PRINCETON UNIVERSITY.** A non-sectarian institution for the higher education of men at Princeton, N. J., founded in 1746. The 1926 fall enrollment totaled 2513, which included 2303 undergraduates and 210 graduate students and fellows. There was a registration of 100 in the 1926 summer session. The faculty

numbered 289. Among the 34 appointments made were those of T. J. Wertenbaker as Edwards Professor of American History, Oswald Veblen as H. B. Fine Research Professor of Mathematics, and G. M. Harper as Woodrow Wilson Professor of Literature on the Edward W. Bok foundation. Changes in the charter of the University provided, instead of a fixed membership of 35 of the board of trustees, a board of not less than 23 nor more than 40, and the required number of New Jersey resident members of the board was reduced from 12 to 8. The total number of books in the library was 600,000, not including pamphlets, broadsides, manuscripts, etc. By the will of David Paton, Egyptologist, his library of 2900 volumes was left to the University with a fund of \$22,400 for maintenance. The Garrett collection of Arabic manuscripts was increased by 500 items of great value purchased from the Baroody and Widgery collections.

A summer school of geology and natural resources was organized by the university under a council consisting of representatives of the British and United States Geological Surveys, the Smithsonian Institution, the Canadian Ministry of Mines, the American Museum of Natural History, the Natural Parks Service, the Pullman Co., and several railroads. The object is to facilitate for American and European students the study of the geology and natural resources of North America, the party of 20 traveling 10,000 miles in a specially constructed sleeping, dining, and lecture car provided by the Pullman Co. The party was conducted by Princeton professors, assisted by local authorities at various points through the North, Northwest, West, and Southwest.

Building operations for the year consisted of the completion of Eno Hall, the psychological laboratory, and the buildings of the artillery department, the restoration of West College to its original form and its extension, and the beginning of an extension to the graduate college. The national alumni association celebrated on alumni day, February 22, the centennial of its founding in 1826 with James Madison as first president. In commemoration of the sesquicentennial of the Declaration of Independence, the graduate council of the national alumni association issued at commencement a bronze plaque in honor of Richard Stockton, 1748, Benjamin Rush, 1760, and President John Witherspoon, the three Princeton signers of the Declaration, and exercises were held duplicating those of 1776 when the Declaration was publicly proclaimed at Nassau Hall.

An important development of the new plan of study for upper-classmen (see 1925 YEAR BOOK) was the arrangement by which a student of high attainment may be relieved of one course in order to devote more time to his particular field. The new endowment known as the Princeton Fund reached during the year the total of \$5,000,000. For an addition to the gymnasium, John D. Rockefeller, Jr., made a gift of \$150,000. President, John Grier Hibben, Ph.D., Litt.D., LL.D.

**PRIVATE BANKS.** See STATE BANKS.

**PROHIBITION.** Any discussion of Prohibition in the United States must be accompanied by many qualifications, and generalizations are, necessarily, far from valuable or useful. It is difficult to say that the Prohibition sentiment is waxing or waning. In New York City it was

realized there never had been Prohibition; in certain parts of the South there never was anything else. Accordingly, the events of the year lend themselves to a variety of interpretations. Newspaper polls did or did not show anything; State referenda were or were not conclusive; debates did or did not convince anybody.

There was only one indication that people could agree about Prohibition, and that was shown in December when almost all quarters joined in denouncing the government's poisoning of industrial alcohol. The heavy toll of alcohol deaths over the Christmas holiday led to severe denunciations of the Treasury Department chemists for failing to find less deadly substances with which to denature alcohol. However, the only assurance emanating from the Treasury was the statement of Lincoln C. Andrews, Assistant Secretary of the Treasury in charge of Prohibition enforcement, that the practice would be continued until the discovery of an effective non-poisonous substitute. The government was attacked in the Senate by Senators Edwards of New Jersey and Copeland of New York and in the House of Representatives by Messrs. Celler and Fairchild. General Andrews declared, further, in the government's defense, that the new formula, No. 5, being used, contained 4 per cent of wood alcohol, and as such was a greater protection to the consumer than anything hitherto used in that "anybody by the taste and smell could know that they were using denatured alcohol."

Senator Edwards cited the following deaths during the Christmas season, which he attributed to "legalized murder by the Government in poisoning alcohol": New York, 730; Philadelphia, 300; Boston, 145; Chicago, 328; St. Louis, 56; Columbus, 8; San Antonio, since June 1, 3; Omaha, 10; Harrisburg, 6; Detroit, 121; Los Angeles, 30; Minneapolis, 28; Seattle, 23; Pittsburgh, 130.

Other developments in the year's history follow:

**ENFORCEMENT.** The Assistant Attorney General in charge of the Division of Prohibition reported signs of progress in the enforcement of the act over the fiscal year ending June, 1926. For example, the number of permanent injunctions was 1150 higher than for the previous year; pending cases were reduced from 24,684 to 20,749; there were 44,492 cases commenced during the year, or 6251 less than the number for the previous year; acquittals during the year numbered 1303, or a reduction of 502 from the previous year.

The government appeared more successful in its attempts to cope with rum smuggling by water-craft. During the year 330 American ships with cargo and 519 American ships without cargo were seized. This first figure should be compared with the 516 loaded boats seized during the year previous. As for foreign ship seizures, 33 ships were captured, of which 25 were of British registry.

The department had participated in two international conferences relating to liquor smuggling. The first was held in Washington in August, 1925, with representatives of Canada. Here regulations were drafted making more completely effective the Canadian-American convention of June 6, 1924. In June, 1926, a similar conference was held with Mexican representatives; the purport was the drafting of regula-

tions to make effective the convention of Dec. 23, 1925.

Also, there was signed on Mar. 4, 1926, a convention with Cuba similar to these two mentioned above. This note from the Assistant Attorney General's report is interesting:

"There are continued evidences of increasing coöperation on the part of foreign governments in connection with the suppression of the rum-smuggling traffic. During this year, our government received an invitation from the British government to attend a conference at London, where the problem should be frankly discussed. This invitation was accepted. The Honduran government has likewise indicated a desire to prevent the use of its flags by liquor runners."

SENATE HEARING. The outstanding event of the year in the history of Prohibition was the hearing conducted before a sub-committee of the Judiciary Committee of the Senate, Apr. 5-24. Its purpose was to ascertain public sentiment on five bills then pending, whose purport was modification in one form or another. The following Senators sat for the committee: Harrel of Oklahoma; Reed of Missouri; Means of Colorado, Walsh of Montana, and Goff of West Virginia. For the "wets," Senators Bruce and Edge made out notable cases. Senator Bruce charged Prohibition with bringing the church into politics; enforcing the puritanical point of view of a minority upon a whole people, encouraging lawlessness, and depriving the government of a valuable source of revenue. He accused Prohibition of being responsible for an increase in deaths from alcoholic poisoning, and pointed out the reprehensible effect in producing a nation of heavy drinkers. Representatives of the American Federation of Labor urged the legalization of the use of light wines and beer. One spokesman declared that while organized labor was opposed to the saloon, "the present state of affairs must be improved upon, or we will be in a state of chaos."

In general, the consensus of opinion pointed to the failure of enforcement. This point of view was given startling confirmation in the testimony of two important government officials, Gen. Lincoln C. Andrews and Emory R. Buckner, United States District Attorney for the Southern District of New York. General Andrews' testimony ran along these lines: Enforcement was proving a failure, as evidenced by the facts that smuggling was going on unchecked across the Mexican and Canadian frontiers; the chief source of supply was not being dried up—i.e., in the diversion of industrial alcohol; corruption has been rampant in the Prohibition unit. General Andrews said that fully 2,000,000 were at present engaged in the illegal alcoholic traffic, and that there were between 40,000,000 and 50,000,000 drinkers. He closed by declaring that the legalized sale of beer, under government control, would aid enforcement. Mr. Buckner gave point to one of General Andrews' statements by charging that fully 60,000,000 gallons of industrial alcohol were being utilized by the bootleg trade for denaturing and sale among the drinking public.

The marshalling of witnesses by the "dry" forces was impressive. A group of representatives appeared for the Women's National Committee for Law Enforcement. Another group represented the Salvation Army. Mrs. Ella A. Boole appeared for the National Woman's Christian Temperance

Union. Some churches, too, were completely represented. The tenor of the dry sentiments seemed to agree on the beneficent influences of the enforcement act in checking poverty, uplifting the position of women, improving moral, social and industrial conditions, etc. Rather than supporting the modification of the law, the dries sought to have more "teeth" put into it. Mrs. Mabel Walker Willebrandt, Assistant Attorney General in charge of Prohibition enforcement, urged the strengthening of the Volstead act, heavier penalties for commercial violations, and a greater number of Federal judges. Prof. Irving Fisher of Yale appeared with an array of statistics to indicate that even if the government had to spend a billion dollars a year for enforcement there would still be a gain, inasmuch as Prohibition's net blessing to the American people was six billions. Professor Fisher's argument is presented in greater detail elsewhere.

The result may be given at this point: Neither side succeeded in impressing the other, and the only thing apparent was the general opinion that enforcement was unsuccessful in the large cities. As for clarifying the issue, it is to be doubted that this elaborate forum availed one tittle.

STRAW VOTES. In the spring, a group of newspapers occupied themselves with an attempt to gauge popular opinion on the question. The final totals as presented were 2,800,000 votes for amendment or modification of the eighteenth amendment and 546,000 for retention and enforcement. The largest poll was taken by the Newspaper Enterprise Association, with 375 papers coöperating. The results of this test were summarized as follows: For retention and enforcement of Prohibition, 329,274; for repeal of the Prohibition amendment, 545,839; for Volstead law modification to allow wine and beer, 864,949.

The voting showed: That almost 50 per cent of those casting ballots favored modification; that the "wet" strength amounted to 81 per cent of the total; that the "drys" led in 83 cities, while in 79 cities of less than 15,000 population the "wets" won; that only two States, Kansas and South Carolina, turned in Prohibition majorities; that in Arizona, Florida, Georgia, Michigan, Tennessee, and Texas the "wet" majority was two to one or less; that the figures indicated a definite trend in favor of modification of the Prohibition act.

It is true enough that polls are interesting; it is doubtful that they are particularly important. First, the voting is not safeguarded; second, the "drys" may have boycotted the whole affair; third, there is little likelihood that the rural districts were adequately represented. But one may compare this poll with another poll. In 1922 *The Literary Digest* conducted a similar vote. Of the 922,383 ballots cast, 356,193 (38.6 per cent) were for enforcement, 376,334 (40.8 per cent) were for modification, and 189,856 (20.6 per cent) were for repeal. In four years, then, the Prohibition sentiment dropped from 38.6 per cent of the votes cast to 19 per cent.

NOVEMBER ELECTIONS. In the November elections, eight States formally voted on the question of Prohibition; these were New York, Illinois, Wisconsin, and Nevada, which recorded opinions on the question of national Prohibition, and Colorado, Montana, California, and Missouri, which voted on the repeal of their State

*Wide World Photos*

### ENFORCING THE PROHIBITION LAW AT SEA

THE SCHOONER "CONSUELO II" WITH A CARGO OF 5000 CASES OF LIQUOR, CAPTURED BY THE UNITED STATES COAST GUARD, AT ANCHOR IN NEW YORK HARBOR WITH THE COAST GUARD CUTTER "PERRY."

enforcement laws. It is interesting to note that these eight States included one-fourth of the population of the country. The results were as follows: For repeal, New York, Illinois, Wisconsin, Nevada, Montana; against repeal, California, Colorado, Missouri. In New York the vote was 1,760,070 for and 598,484 against, on the question, "Should the Congress of the United States modify the Federal act to enforce the eighteenth amendment so that the same shall not prohibit the manufacture, sale, transportation, importation, or exportation of beverages which are not in fact intoxicating as determined in accordance with the laws of the respective States?"

Despite the vote, it is important to note that in the same elections the "drys" maintained their control of the House of Representatives, the division being, 320 "drys," 109 "wets," and a handful of doubtfuls.

None the less, this heavy vote in favor of modification presaged to the observers important political happenings. It was obvious that Prohibition was an outstanding political issue, and that such a heavy turn-out of votes must make politicians pay heed to the opinions of a large body of the electorate. The "drys" seemed little ruffled. Their leading advocate, Wayne B. Wheeler general counsel and superintendent of the Anti-Saloon League of America (q.v.), insisted that in New York the "drys" abstained from voting; that changes in the Volstead definition of intoxicating liquors were out of the question; and that the State votes were only "wet" propaganda for the purpose of bringing the Prohibition law into disrepute.

DEBATES. In the debates that have begun to characterize the history of Prohibition (one must go back to the slavery question for an analogy in American political annals), the observer is in a quandary as to the exact location of the truth. The whole affair has been invested with an extraordinary scientific air. There are columns of statistics on one side, countered by columns of statistics on the other. (Needless to say, the sources of the statistics are often absent, and thus they, too, help to becloud the issue rather than clarify it.) One of the most cogent pro-Prohibition arguments put forward was that to be found in Prof. Irving Fisher's book, *Prohibition at its Worst*. Professor Fisher's argument was, in fine, that while enforcement was startlingly lax, and while there were marked expressions of dissent in certain districts, Prohibition "at its worst" was far better than the period prior to its adoption. Professor Fisher's conclusions were thus presented by himself: 1, the present situation of imperfect enforcement is intolerable; 2, conditions are not, however, as bad as commonly represented; 3, Prohibition has accomplished much good hygienically, economically and socially; 4, The "personal liberty" argument is largely illusory; 5, we cannot accomplish what the opponents of Prohibition really want by amending the Volstead act without thereby violating the eighteenth amendment; 6, to repeal the eighteenth amendment is out of the question; 7, to nullify it would mean disrespect for law, of the most demoralizing kind; 8, therefore, the only practicable solution is to enforce the law; 9, enforcement is a practical possibility. There is a painstaking examination of statistics cited particularly by the Moderation League, with the conclusion that the

consumption of alcohol to-day "is certainly less than 16 per cent, and probably less than 10 per cent, and possibly less than 5 per cent, of pre-Prohibition consumption." Statements of this order add to the current bewilderment. Where did Professor Fisher get his figures? And if the case be as he presents it, how can he reconcile such a belief with his previously expressed one that the present state of enforcement is intolerable? What, too, is to be done with the Moderation League's investigations which presume to disclose that in 1925 drunkenness increased 100 per cent over 1924; that in 509 places, arrests for drunkenness in 1925 increased 129 per cent over those for 1920; and, finally, that conditions in the "dry" States are worse to-day, as compared with 1914, than are conditions in the "wet" States. The Moderation League, too, cites figures to indicate the increase of drunkenness among drivers and the increase in drinking among young persons. Merely as an example of the curious pass to which the whole question has been brought, one may cite the fact that *The Literary Digest* made a survey among the young of the country; its conclusion was that the younger generation of Americans was not drinking.

One must turn to the lucid writings of that cogent political thinker, Walter Lippmann, for a way out of this jungle. In the December *Harper's* he cuts through the whole wild tangle of this debate to point out that while the eighteenth amendment cannot be repealed because of peculiar constitutional provisions, there would not be the slightest chance of its passage to-day; that popular nullification of the amendment is not treasonable (*vide* the histories of the fugitive slave law and the fourteenth and fifteenth amendments); that no law is enforceable when popular sentiment is against it; and that we may well leave the final determination of enforcement to the wisdom of the Supreme Court, which has always found a means of reconciling reason with the letter of the law.

CHURCH DIFFERENCES. Early in the year, Dr. James Empringham, National Secretary of the Episcopal Church Temperance Society, made a statement that seemed to indicate profound discord in the Episcopal churches. As a result of a referendum and a survey, Dr. Empringham reported that his society stood as follows: 1, in favor of a modification of the Volstead law to permit the sale of beer and wine, because the effect of Prohibition has been to put an end to scientific temperance teaching; 2, it [Prohibition] has resulted in increased drinking among young people; 3, it has discouraged the consumption of wine and beer and increased the demand for distilled liquors, which to-day are mostly poisonous; 4, it has brought about disrespect for laws; 5, it is class legislation, discriminating in favor of the rich.

"In our survey we found intemperance increased," the statement said. The report resulted in interested statements from church dignitaries. *The New York Times* canvassed the Protestant Episcopal bishops, and found that five stood for modification, while eighteen were opposed. Bishop Manning of the New York diocese repudiated the survey as being not representative, and declared it as his belief that the "Prohibition law, properly enforced, will make us healthier and better people," and that

"these laws can be and ought to be enforced, and are being more and more enforced."

Other church groups immediately made public their views. Baptist, Reform Church, Presbyterian, Methodist Episcopal clergymen attacked modification. The statement of Dr. S. Parkes Cadman, President of the Federal Council of Churches of Christ in America, had this to say: "I am in favor of enforcing the law as it stands and asking every loyal-hearted citizen to support it. We have never tried Prohibition yet. I refuse to consent to dismiss it, until it has been fairly tried." Two cardinals of the Roman Catholic Church made significant statements that indicated the official attitude of that church. Cardinal Hayes said, "if immorality flows out of intemperance, it must be prohibited, but there is no reason why you should put Prohibition on 100,000,000 people to punish the intemperance of individuals." Cardinal O'Connell's attitude was largely similar.

**ADMINISTRATION.** Toward the end of the year, General Andrews announced that he planned to go before Congress with a proposal for the creation of a government corporation to manufacture and distribute medicinal whisky. A Department of Treasury statement, in announcing the project, pointed out the following reasons for the step; 1, it would mean a saving of about \$1,000,000 a year in the administration of the Prohibition law; 2, pure whisky for the patient on doctor's prescriptions; 3, a reasonable cost to the purchaser; 4, it provides for the replenishment of the supply of medicinal spirits, as required by law; 5, it does away with the present pressure of salesmanship in a competitive market trying to sell privately owned liquor, and this reduces the amount sold to the natural and honest requirements of the medical profession; 6, it cripples the bootleg industry. General Andrews pointed out in his statement that, with respect to medicinal whisky, 12 states prohibit the prescription of any intoxicating liquors, while 10 other States allow only the prescription of pure alcohol.

**SUPREME COURT.** In November, the court handed down another decision for the purpose of clarifying the Prohibition enforcement act. By a unanimous vote it approved of a ruling of the Louisiana Supreme Court that a violation of State and National Prohibition laws was a criminal offense against both governments, and hence liable to punishment by agencies of both. On November 29, by a vote of 5 to 4, the Supreme Court further went on record as approving the Federal law limiting the prescription of whisky by physicians to one pint every ten days or "three tablespoonfuls per day." The case was originally brought up by Dr. S. W. Lambert of New York, whose contention was that it interfered with the practice of medicine. Those who voted in the affirmative were Chief Justice Taft and Associate Justices Brandeis, Holmes, Van Devanter, and Sanford. The negatives were cast by Associate Justices Sutherland, McReynolds, Butler, and Stone.

**FOREIGN.** In the fall, the people of Norway in a popular referendum voted to go "wet" by a vote of 525,423 to 415,637. The vote was held for the purpose of retaining or rescinding a limited Prohibition law then on the statute books. It is curious to relate that the existing law allowed the sale of liquor with an alcoholic content as great as 21 per cent. Prohibitionists,

however, pointed out that the vote was to a large extent guided by economic exigencies, in that under the old statute the consumption of French, Spanish, and Portuguese wines had been barred. These countries threatened to abrogate their "most-favored-nation" treaties with Norway if the ban continued, with the result, apparently, that discretion became the better part of valor. See *NORWAY*, under *History*.

In the Province of Ontario, Canada, in the general election of December, Premier G. Howard Ferguson, Conservative, won a great victory for the "wets." His party's platform, in brief, stood for the enactment of a law authorizing the sale of liquor in government stores, subject to local option, and for another law permitting all persons over 21 to purchase liquor or beer at reasonable cost from these government stores. Premier Ferguson's Conservative followers elected 75 of their party to the Provincial House, carrying all of Toronto's 15 seats. The result of this election will be that after Jan. 1, 1927, in all of the Canadian Provinces, with the exception of the Maritime, the government will control the liquor trade.

**PROTESTANT EPISCOPAL CHURCH.** A religious denomination representing the Anglican communion in the United States, of which the Church of England is the parent church, and which was brought to this continent with the Jamestown colonists in 1607. The first American service from its Book of Common Prayer, however, was held in the year 1579, on the first Sunday after Trinity, on the Pacific coast near the present city of San Francisco, when the Rev. Francis Fletcher, chaplain of the fleet under command of Sir Francis Drake, conducted service, preached a sermon, and celebrated Holy Communion. The Virginia colony was permanently established with regular ministrations of the Church in 1607. Despite the absence of a colonial episcopate, the Church, under English clergymen, maintained a firm foothold for 170 years. In 1785, the first American bishop was consecrated in Scotland, and three years later two more were appointed, and from these all of the American bishops have succeeded. The Church completed its organization at a convention in Philadelphia in October, 1789, at which the constitution and name were adopted, and a Book of Common Prayer was set forth. The Episcopal Church maintains active missionary enterprises in Japan, China, Liberia, Mexico, the Philippines, Alaska, Hawaii, Brazil, the Canal Zone, Cuba, Porto Rico, Haiti, the Dominican Republic, the Virgin Islands, and Palestine, and is represented by establishments in 10 important European centres. Its domestic missionary activities include work among the foreign-born, American Indians, negroes, mountaineers, mill communities, and a wide range of social service. Five colleges and many educational institutions represent the interest of the Church in this field.

The government of the Church centres in a General Convention which meets triennially. The affairs of the Church between sessions are conducted by a National Council made up of 16 representatives elected by the General Convention, of whom four are bishops, four priests, and eight laymen, supplemented by eight others named by the eight provincial synods. This Council conducts its work with the aid of three major departments, missions, religious education,

social service, and three others, finance, publicity, and field. The Council is also the Board of Directors of the Domestic and Foreign Missionary Society, conducted through the Department of Missions and Church Extension. The presiding bishop of the Church, elected by the General Convention, is also president of the National Council. The whole work of the Church is incorporated in a general church programme adopted triennially, and in 1925 involving an annual expenditure of \$3,959,899. Of this sum the total expenditure for missions, domestic and foreign, was \$2,575,646, divided in practically equal amounts between the domestic and foreign fields. The number of missionaries who were supported in whole or in part by appropriations through the Department of Missions during the year 1925 was as follows: American missionaries abroad, men 201, women 242; native staff abroad, men 1451, women 714; American missionaries in the United States, men 571, women 128; native staff in the United States, men 94, women 5, making a total of 3406 persons representing the missionary staff in 1925. During the year 57 missionaries were appointed.

In 1926 there were reported 6159 clergy, an increase of 19 over the preceding year. The total number of communicants was 1,200,987, an increase of 7666 over the preceding year. The total contributions to all causes within the Church were \$43,313,716, an increase of \$1,567,660 over the preceding year. In 1925 there were 6000 Church schools, with 494,413 pupils, directed by 57,290 Sunday school teachers, an increase of 15,000 over 1924. The 15 theological seminaries of the Church reported a decrease of 14 in the number of candidates for the ministry.

The National Council is assisted in its work by a group of cooperating agencies. The Woman's Auxiliary, through a thank offering each triennium, contributes nearly \$1,000,000 in that period for its work. Other cooperating agencies are the Brotherhood of St. Andrew for men; the Daughters of the King; the Guild of St. Barnabas for nurses; the Churchwomen's League for Patriotic Service; the Knights of St. Paul, the Knights of St. John, the Knights of Washington, and the Order of Sir Galahad, for boys; for girls and young women, the Girls' Friendly Society in America; for young people in general, the Young People's Fellowship. The Church Mission of Help is notable among affiliated organizations dealing with a wide range of Church interest and activity. The Church publishes *The Spirit of Missions*, *The Church at Work*, and *Bulletins* of the National Council, together with material dealing particularly with each department of the National Council. Six independently owned publications make an important contribution to the cultural life of the Church: *The Living Church*, weekly; *The Churchman*, weekly; *The Witness*, weekly; *The Southern Churchman*, weekly; *The American Church Monthly*; and *The Chronicle*, monthly. In addition there are 80 monthly diocesan publications in the home field and a score of others in the mission field.

The year 1926 was marked by the death of only one among the bishops of the church, the Rt. Rev. Edward William Osborne, D.D., (q. v.), retired, sometime bishop of the diocese of Springfield. The Rt. Rev. Theodore Payne Thurston, D.D., Bishop of Oklahoma, resigned, and the Rt. Rev. Eugene Cecil Seaman, D.D., of North Texas, was appointed by the presiding bishop of

the church as his substitute until an election should be held. The Rt. Rev. Henry St. George Tucker, D.D., sometime bishop of Kyoto, Japan, was elected bishop coadjutor of Virginia. The Rt. Rev. Edward Campion Acheson, D.D., suffragan Bishop of Connecticut, was elected bishop coadjutor of Connecticut. The Rt. Revs. Walter Mitchell, D.D., Frank W. Creighton, and Shirley H. Nichols, elected bishops at the New Orleans session of the General Convention in October, 1925, were consecrated during 1926. The Rt. Rev. John Thomas Dallas was elected bishop of New Hampshire and consecrated May 4, 1926. The Rev. Edward Trail Helfenstein, D.D., was elected bishop coadjutor of Maryland and was consecrated Dec. 28, 1926. The headquarters of the National Council are in the Church Missions House, 281 Fourth Avenue, New York City.

**PRUSSIA**, prûsh'â. A constituent republic of the German republic; a kingdom of the German Empire until the October revolution of 1918; proclaimed a republic Nov. 13, 1918. Capital, Berlin. Area, Oct. 1, 1925, 113,204 square miles, as compared with 135,134 square miles before the war; population, according to the census of 1925, 38,170,633, as compared with 40,165,219 in 1910. The later figures for area and population are exclusive of the Saar district, Eupen and Malmédy, and the territory of Upper Silesia which was ceded to Poland; showing a loss to Prussia, as a result of the Treaty of Versailles, of 21,645 square miles and a population of 4,601,626. The movement of population in 1924 was: Births, 812,278; deaths, 486,611; marriages, 273,054. The chief cities with their populations in 1925, according to provisional figures of that census year, were: Berlin, 3,931,071; Cologne, 693,266; Breslau, 550,313; Essen, 466,088; Frankfurt-on-Main, 458,422; Düsseldorf, 428,999; and Hanover, 414,108. The accompanying table from the *Statesman's Year Book* for 1926 shows the area under the principal crops and yield in metric tons for 1924:

	Acres	1924	Tons
Wheat .....	2,081,982		1,507,503
Rye .....	7,924,228		4,355,065
Summer barley .....	1,870,808		1,448,733
Oats .....	5,885,701		4,026,842
Potatoes .....	4,543,138		25,759,330
Hay (meadow) .....	6,887,184		11,050,636

In 1924 vineyards had an acreage of 40,035 with a yield of 11,810,308 gallons of wine valued at 29,581,803 marks. On Dec. 1, 1924, the livestock included: Cattle, 9,665,191; sheep, 3,827,040; swine, 11,426,238; goats, 2,569,460; horses, 2,681,641; and poultry, 43,820,095. The chief minerals are coal, lignite, iron ore, and salt. The railway mileage, which has been taken over by the federal government, is about 20,000. The government is under a diet and a state council, the members of the former being elected for four years by secret and direct ballot on the basis of proportional representation. The latter is elected by the provincial assemblies on the basis of one for every 50,000 inhabitants. The executive, which exercises the functions of the former king, is vested in the ministry, which is

appointed by the prime minister elected by the diet. As a result of the elections of Dec. 7, 1924, the following parties were returned: Social Democrats, 114; Centre (Catholics), 81; German National Party, 109; National Socialists, 11; German People's Party, 45; Democrats, 27; Communists, 44; Economic Party, 11; German Hanoverians, 6; and Polish Party, 2; total 450. The Prime Minister at the beginning of the year was Otto Braun (Socialist), appointed Apr. 4, 1925.

**PSYCHICAL RESEARCH.** A symposium on The Case for and Against Psychical Research was held under the auspices of Clark University, at Worcester, Mass., Nov. 29 to Dec. 11, 1926. The speakers included Prof. Joseph Jastrow of the University of Wisconsin; Dr. L. G. Crandon, the husband of the medium Margery; Dr. Walter F. Prince, of the Boston Society for Psychical Research; Prof. F. C. S. Schiller, of Oxford; Dr. Gardner Murphy, of Columbia University; Frederick Bligh Bond, English author and member of the British Society for Psychical Research; Margaret Deland, American novelist; and Prof. Hans Driesch, of the University of Leipzig. In addition, manuscript papers were read from Prof. William McDougall, Sir Arthur Conan Doyle, J. E. Coover, Mary Antin, and others.

The symposium brought out the customary range of opinion, from the absolute skepticism expressed by Jastrow, the religious conviction of Doyle, down to the attitudes of scientific "watchful waiting" expressed in different forms by McDougall and Prince.

Sir Arthur Conan Doyle's paper began the symposium with an attack on natural science, which was characterized as turning the universe into "a mere clockwork mechanical wonder swinging in a vast vacuum." Sir Arthur saw in the spiritualist interpretation of psychical phenomena a refuge for true believers in the religious nature of the universe. Toward experimental psychical research the English author expressed an attitude of half-scorn, seeing in it a rather external way of dealing with the problem.

"I consider," he said, "all this work of experimental psychic research, though very useful and necessary, to be a sort of supermaterialism which may approach but does not touch the heart of the subject. That heart is, in my opinion, a purely religious one. The ultimate aim of the whole movement is to afford earnest minds in this age of doubt and stress some method of gaining a knowledge of our duties and our destiny which shall be dissociated from outworn observances and conflicting faith, so that by actual contact with intelligences which are now above our own we may pick our path more easily amid the morass of religion. The ultimate result will be the union of science and religion, and such an increase of inspired knowledge as will lift humanity to a higher plane and send it reassured and comforted upon its further journey into the unknown."

Dr. L. G. Crandon, husband of the medium Margery, also made use of the religious argument, but not in the same way as Sir Arthur. He seemed to see in scientific psychical research a scientific way of proving the aspirations of faith, and thus obtaining something more satisfying than "the sleepy comfort of religion." He admitted, however, that a proof

100 per cent perfect cannot now be obtained, although he hoped for much greater proof in the future. Dr. Crandon expressed his belief in the authenticity of the creation of ectoplasm by mediums. Ectoplasm, he said, was the primordial substance of the world.

In contradistinction to the views of these two convinced believers in psychical phenomena may be cited the address of Prof. Joseph Jastrow, of the University of Wisconsin. Professor Jastrow showed himself a convinced opponent of any belief which accepts psychic phenomena as genuine. He saw the antecedents of present-day spiritualism in traditional occultism which believed in astrology, divination and other pseudo-sciences. He put the arguments for the truth of psychical phenomena in the same class with the arguments for the truth of witchcraft. Professor Jastrow did not oppose the experimental study of abnormal phenomena of the type called psychic, but he insisted that in all such experiments the experimenter, and not the medium, should be the one to exercise the control.

The paper of Prof. William McDougall and the address of Dr. Walter F. Prince were both more moderate in tone than the opinions of Dr. Crandon and Sir Arthur Conan Doyle. On the other hand, they did not put psychical research in the same class with witchcraft. Professor McDougall's manuscript address hinted at the possibility of the existence of ghosts, though not in supernatural form. He put it thus: "There has been gathered a very weighty mass of evidence indicating that human personality does not always at death cease to be a source of influence upon the living. I am inclined to regard as part of this evidence the occurrence of ghostly apparitions. It seems to me that in many of these experiences there is something involved that we do not understand at all, some causal factor or influence other than disorder within the mental processes of the percipient. I hold that a case has been made out, for clairvoyance, of such strength that further investigation is imperatively needed."

Professor McDougall pointed out that he was not convinced of the supernormality of any of these phenomena, but that he felt that science should investigate all alleged causes with the utmost impartiality.

Dr. Prince made a plea for more critical but sympathetic investigation. He thought that very possibly the alleged production of ectoplasm might be attributed to the inexperience of the European mind, not so keenly attuned to skepticism as was the American mind through long and sad acquaintance with fraud. Dr. Prince went on to say that he believed something convincingly true would arise from an investigation of spiritism, and that true psychic science would some day arise, just as astronomy did from astrology, and chemistry from alchemy. It was as foolish, he said, to use the "will to believe" the spiritistic hypothesis, as it was to use the "will to disbelieve" to reject it.

Dr. Prince declared that all psychical researchers are agreed as to the existence of these four types of phenomena: 1, Telepathy; 2, veridical apparitions; 3, mediumistic deliverances, and 4, psychometry, or the ability to recite during contact with a strange object facts true of a person connected with the object, yet not inferable from the object itself.

"Many scientific men have been convinced of ectoplasm," he added. "I have never seen any exhibition of it or heard any careful description which was in the least convincing to me. Whether there is a genuine product of that name I will not undertake to decide."

Frederick Bligh Bond hailed psychic science as the science of the future which will advance and make permanent human civilization. "Just as we have seen chemistry evolve from the obscure practices and superstitious beliefs of alchemy," he pointed out, "so the yet more vital science which is destined to determine the laws of the human soul in its relation to its material organism and environment is now forcing itself inevitably into the light, and already beginning to claim for itself the like measure of recognition which has been so painfully won by the sister sciences against the repressive forces of ignorance, intolerance, and reaction."

**BIBLIOGRAPHY.** New books on psychical research include the following: Harry Price, *Expériences Scientifiques avec un Nouveau Médium (Stella C)*; Henrietta Lovi, *Best Books on Spirit Phenomena (1847-1925)*; Sir Arthur Conan Doyle, *The Land of Mist*; Walter F. Prince, *The Psychic in the House*; Rudolph Tischner, *Der Okultismus als Natur und Geisteswissenschaft*.

**PSYCHO-ANALYSIS.** Psycho-analysis lost two leading workers by the deaths of Karl Abraham and James Glover. Dr. Abraham, who died Dec. 25, 1925, was perhaps the leading psycho-analyst in Berlin and he served as President of the International Psycho-Analytic Association. Dr. Glover was one of the best known English workers in the field. He died Aug. 25, 1926.

**FREUD BIRTHDAY ANNIVERSARY.** On the occasion of the 70th birthday of Sigmund Freud, the founder and leading spirit of the psycho-analytic movement, psycho-analysts from all over the world sent congratulations to Vienna. *The International Journal of Psycho-Analysis* (vol. vii) devoted a double number to the celebration of the anniversary, and printed a personal tribute to Freud by S. Ferenczi. From this tribute we select a paragraph as giving perhaps a better indication of the present state of the psycho-analytic movement than a multitude of abstracts of technical papers.

Having accorded Freud the most fulsome praise, Dr. Ferenczi turned to consider the personal relations between Freud and his fellow workers in the field. "Let me say then," he continued, "that there is scarcely one of us who has not had to listen occasionally to hints and exhortations from the master which sometimes destroyed magnificent illusions and at the first moment gave rise to a sense of injury and depreciation. At the same time I must testify that Freud often gives us perfect liberty for a long while and allows great latitude to individual idiosyncrasies before he decides to interpose as a moderating influence or to make decisive use of the means of defense at his command; he resorts to the latter course only when he is convinced that compliance would imperil the cause that is to him more important than anything else. Here he certainly admits of no compromise and is ready to sacrifice, even though with heavy heart, personal ties and hopes that have become dear to him. In these things he is as severe towards himself as towards others. He

watched with sympathetic interest one of his most gifted scholars until the latter advanced the claim that he could account for everything with his *élan vital*. Once, several years ago, I myself came forward with the theory that a death instinct would explain all. Freud's verdict was not favorable to the idea, and my faith in him enabled me to bow to his judgment; then one day appeared *Beyond the Pleasure Principle*, in which his theory of the interplay of death instincts with life instincts does far more justice to the manifold facts of psychology and biology than my one-sided conception could accomplish. The idea of organic inferiority interested him as a very promising beginning for the somatic foundation of psycho-analysis. For years he accepted its author's rather peculiar mode of thought as part of the bargain; but when it became clear that the latter was using psycho-analysis simply as a springboard for a teleological philosophy, Freud gave up all collaboration with him. For a long time he overlooked even the scientific gambols of one of his followers because he recognized his acute sense for sexual symbolism. The great majority of his adherents, however, have overcome the sensitiveness that is inevitable in this situation, and are convinced that all their legitimate personal efforts will sooner or later be accorded a place in Freudian psycho-analysis."

The paragraph we have cited is revealing in more than one sense. It indicates that not only is the one-type explanation (sex or libido) dominant in psycho-analysis, but that it is also a one-man science. Perhaps we may be allowed to cite in this connection an anecdote brought back from Vienna which describes the extreme reverence with which Freud is held among his disciples. An American reporter was discussing psychology with one of the "most brilliant younger disciples of Freud." Speaking of a certain work, the reporter remarked: "It is hard to find any book where every word is beyond question. No man is God." "No," the Austrian mused, "of course no man is God." Then he sat up suddenly and explained: "Yes, yes, one man is God—Freud." He pointed to his newly bought complete writings of Freud, in ten volumes. "Every word in these ten volumes is absolutely correct. Freud is 100 per cent correct. No—200 per cent. Every word Freud has written is absolutely correct. Every word Freud will write is absolutely correct." (We quote this anecdote from McDougall's preface to his *Outline of Abnormal Psychology*.)

All this is not altogether in dispraise of psycho-analysis. It has undoubtedly been the peculiar mission of psycho-analysis to direct attention to the dominant place that sexuality holds in our sub-conscious life. And just as it needs a certain amount of exaggeration to drive a truth home to the general public, so perhaps it needs the uncompromising energy of one man to prevent that truth from becoming too diluted. Hence Freud.

**BIBLIOGRAPHY.** New books on psycho-analysis include: Geraldine Coster, *Psycho-Analysis for Normal People*, and Maximilian Steiner, *Die Psychische Störungen der Männlichen Potenz: ihre Tragweite und ihre Behandlung*. The first named is a good general account of the movement, although it has been taken to task for its unorthodoxy by Freud's 100-per cent disciples. The second work is by a German sexologist, who

approached the problem of male sexuality from the medical point of view. The book carries a foreword by Freud. Other books of psycho-analytic character that should be mentioned are Horace Carncross, *The Escape from the Primitive*; Bronislaw Malinowski, *Crime and Custom in Primitive Society*; and Louis Waldstein, *The Sub-Conscious Self and Its Relation to Education and Health*. Among the important or interesting articles in the psycho-analytic press are the following (all in the *International Journal of Psycho-Analysis*, vol. vii): Karen Horney, "The Flight from Womanhood"; Karl Abraham, "The Psychological Relation between Sexuality and Alcoholism"; Ernest Jones, "The Origin and Structure of the Super-Ego"; and C. Müller-Braunschweig, "The Genesis of the Feminine Super-Ego."

**PSYCHOLOGY. NEWS OF MEETINGS.** The 26th annual meeting of the American Psychological Association was held at the University of Pennsylvania, Philadelphia, Dec. 28-30, 1926. Prof. Harvey A. Carr, of the University of Chicago, delivered the presidential address.

The Eighth International Congress of Psychology was held at Groningen, Holland, Sept. 6-11, 1926. Symposia were read on the following topics: Understanding and Explanation, by Dr. Binswanger of Kreuzlingen, Dr. Jaspers of Heidelberg, and Dr. Spranger of Berlin; Intensity of Sensations, by Dr. Boring of Harvard, Dr. Myers of London and Dr. Werner of Hamburg; Form Qualities, by Dr. Benussi of Turin, Dr. Koffka of Giessen, and Dr. Michotte of Louvain; Behaviorism, by Dr. McDougall of Harvard, and Dr. Pieron of Le Vésinet; Psychology of Primitive Races, by Dr. Bartlett of Cambridge, Dr. Lévy-Bruhl of Paris, Dr. Mayer of Heidelberg, and Dr. Storch of Tübingen; Religious Psychology, by Dr. Janet of Paris, and Dr. Leuba of Bryn Mawr. Other papers were read by Drs. Marbe, Spearman, Stern and Thurstone.

The twenty-third annual meeting of experimental psychologists was held at the University of Pennsylvania, Apr. 5-7, 1926. The first day of the meeting being the 125th anniversary of the birth of Gustave Fechner, a number of papers were read on psycho-physics and its relation to present-day psychology.

A meeting of mid-Western experimental psychologists was held at Northwestern University, Evanston, Ill., May 7-8, 1926. The meeting was attended by 100 psychologists, and was the first meeting of its kind for over 20 years. There were discussions of experiments on the psychophysiology of sleep, the psychology of athletics, hypnotism, and a number of topics in applied psychology.

**GENERAL.** As Prof. Madison Bentley pointed out in his presidential address of 1925 to the American Psychological Association (published in *Psych. Rev.*, March, 1926), psychology is now in the peculiar position of an established science tolerating complete disagreement as to its fundamental postulates and presuppositions. The situation, however, is not as discouraging or as hopeless as the statement seems to imply. And for this, two reasons may be given. The physical deadlock between the various schools is leading to an eclectic tolerance of opposing views, and this compulsory tolerance is in turn leading to a critical questioning of accepted dogmas. By the operation of these two factors, it is to be hoped, there will develop a scientific orientation deep

enough to take in what is positive in the opposing methods and yet avoiding the dogmatic metaphysics which generally goes with it.

Professor Bentley himself pleaded for the consideration of the various schools, not as rival sects, but as representative of various intellectual categories which have proved more or less fruitful in the organization of psychological phenomena. Under this method, he attempted a classification of the major categories governing psychological science. The category of objectivity, though wider than behaviorism, was typified by the behaviorist school, which sought to reduce psychological science to such entities and laws as go to make up the objective world. Professor Bentley paid his respects to behaviorism and admitted that it served as a healthy reaction against the vices that had grown up, but denied that one could constitute, without question-begging, a complete science on the stimulus-response formula. Turning to the opposite category, he said this was not subjectivity but conscious experience. Here he distinguished seven forms or methods of applying this category as elaborated during the past 40 years. These were: (1), the fluent consciousness of James; (2), the conscious acts of Brentano; (3), productive and creative powers of the Austrian school; (4), constellated processes of Wundt; (5), attributive characters; (6), functional performance of psycho-somatic kind; (7), configurative experience or *Gestaltpsychologie*.

The last form, said Professor Bentley, now seemed predominant in American psychology, the tendency for it having started even before the spread of the German *Gestalt* movement. A number of other articles published during the year dealt with plans for reconciling the various schools, but most of them were weak, from a critical and philosophical point of view.

In view of the difficulties involved in psychological doctrine and general theories of mind, there has been a great trend towards statistical experiments. Such experiments could dodge, it was thought, all question of system. But if they could dodge to a certain extent the question of system, they could not well dodge the problem of the proper interpretation of statistical results. In this respect a more critical attitude is now becoming manifest, if we are to judge by a number of signs.

One of these signs is the passage of a resolution by the meeting of experimental psychologists, deploring the increasing use of the questionnaire method. The resolution strikes at a practice which had become all too common, of collecting a miscellaneous array of facts and opinions, putting them through the statistical machine, and then announcing universal scientific laws. The text of the resolution follows:

"Resolved that this meeting deplores the increasing practice of collecting administrative and scientific data by way of questionnaires; and that the meeting deplores especially the practice under which graduate students undertake research by sending questionnaires to professional psychologists."

The resolution was voted by Profs. E. G. Boring of Harvard University, Charles W. Fernberger of the University of Pennsylvania, E. S. Robinson of the University of Chicago, H. S. Langfeld of Princeton, E. B. Titchener of Cornell, and R. S. Woodworth of Columbia.

Another indication of the critical spirit with

regard to statistical findings is furnished by the discussion of E. G. Boring (*Amer. Jour. of Psych.*, vol. 37, 303) on Scientific Induction and Statistics. Professor Boring's great concern is to point out the difference between the description of immediate experimental facts and the scientific induction of laws, as well as to indicate the intellectual responsibility involved in the latter process.

"When we can say that A is greater than B," he writes, "the process of this phase of description is ended. When, however, we have many A's and many B's and some B's are greater than some A's, we have to resort to statistics to state the tendency for A to be greater than B. Here I think we are still mainly at the descriptive level. We come certainly to induction when we wish to assert that all A's tend to be greater than all B's; that is to say, any group of A's will on the average be greater than any group of B's. We have then to decide whether we shall regard our particular A's as a fair sample of all A's. . . .

"It is an illusion that this trick is turned by dividing the probable error of the single observation by the square root of the number of cases in order to give you the probable error of the mean. Such a probable error of a mean cannot be a prediction of the way in which means of new groups of A's will vary, because the central trend of new groups depends, not on anything inherent in the first group, but on the changed conditions that make the group new and not identical with the old."

The article concludes with a plea that statistical results be "evaluated" before being framed into inductive laws. In so far as the evaluation departs from the statistical finding, the departure should be, according to Professor Boring, in the direction of conservatism.

Echoes of the behavioristic controversy still appear in the psychological journals, as do discussions of the *Gestalt* theory. For the most part, however, it would seem that the sharp controversial tone of a few years ago has disappeared, even if it has not been replaced by unanimous agreement.

**BIBLIOGRAPHY.** New text-books and general works on psychology include the following: E. S. Robinson, *Practical Psychology*; Charles K. Ogden, *The Meaning of Psychology*; Leonard T. Troland, *The Mystery of Mind*; Paul Bousfield, *Pleasure and Pain*; Theodor Lipps, *Psychological Studies*; Mary Collins and James Drever, *Experimental Psychology*; Hans Driesch, *Grundprobleme der Psychologie*; K. H. Hulbert, *Rhythm in Feeling*.

Below are given reviews of the special fields of psychology in the following order: *Experimental*; *Comparative and Animal Psychology*; *Mental Measurement and Educational Psychology*; *Applied Psychology*; *Abnormal Psychology*; *Social Psychology*. Books on special subjects are listed under the respective heads.

**EXPERIMENTAL PSYCHOLOGY.** The *Psychological Bulletin* (vol. xxiii, p. 1) carries a special review by K. M. Dallenbach of recent experimental work in the field of Attention. Professor Dallenbach lists a great number of experiments, but as there are so many different points of view behind the experiments it is impossible to come to any conclusion as to present trends. Thus, Foucault and Pieron (French psychologists) are interested in the theoretical problem and are

preoccupied with combating the faculty notion of Attention. On the other hand, many Americans are interested either in reaction times or in the coordination of Attention for educational purposes. One experimenter (Tuttle) launches a physiological definition of Attention: Attention = muscle tonus. In this connection one should read the papers of Raymond Dodge on the related problem of Inhibition and also the article of McDougall on "The Drainage Theory of Inhibition" (both in *Psych. Rev.*, vol. xxxiii).

The *Psychological Bulletin* also carries special reviews of *Cutaneous and Kinesthetic Senses* (T. Metcalf); *Color Defects* (S. P. Hayes); *Visual Illusions*, with special reference to seen movement (P. C. Squires); *Synæsthesia* (Herbert S. Langeld); *Motor Automatism* (F. Fearing); *The Psycho-Galvanic Reflex* (H. Woodrow); and *Sleep* (H. M. Johnson, T. H. Swan, and C. E. Weigand). (For page numbers see index, vol. xxxiii.)

A volume of experimental researches on sound as related to language was published by Carl Stumpf (*Die Sprachlaute: Experimentell-Phonetische Untersuchungen*). From Germany also come two volumes of studies from the laboratory of Felix Krueger, under the title of *Neue Psychologische Studien*. The first volume of studies deals with form qualities and sentiments (*Komplexqualitäten, Gestalten und Gefühle*), while the second volume comprises papers on light and color.

**COMPARATIVE AND ANIMAL PSYCHOLOGY.** Much experimental work continues to be done in this field, and a number of systematic works have been published during the year. Prof. Carl John Warden, who is in charge of comparative psychology at Columbia University, has written a text-book on the subject under the title, *The Historical Development of Comparative Psychology*. A more specialized work on *The Brains of Rats and Men* was published by C. Judson Herrick. This last work is of special interest to neurologists.

A review of recent experimentation in animal psychology is to be found in the *Psychological Bulletin* (vol. xxiii, 19) prepared by J. Paul Visscher. Prof. L. T. Carmichael publishes in the *Psychological Review* (vol. xxxiii, 51) the results of his experimental findings on The Development of Behavior in Vertebrates Experimentally Removed from the Influence of External Stimulation. He finds in general a condition of interdependence existing between the organism and the environment, and holds against both the extreme theory of environmental influence and the extreme theory of heredity.

A polemic on the utility and reliability of the maze experiments was carried on in the columns of the *Jour. of Comp. Psych.*, (vol. vi, pp. 85, 393) between W. S. Hunter and Harvey A. Carr. Basing himself on a series of experiments carried on by himself and his pupils at the University of Kansas, Professor Hunter had challenged the reliability of the maze-reaction experiments for accurate findings. He believed it impossible to achieve standard conditions, such as are used in physical experiments. Professor Carr replied that conditions can be made sufficiently standard for the purpose of the experiments, and that with added precautions the range of reliability can be improved. To this Professor Hunter replied as follows:

"What we sought was the reliability of various

mazes with various types of subjects when customary methods of experimentation were used. It is quite possible that if new methods were employed, the results would be more dependable. If diet, daily exercise, general health, temperature, seasons, etc., were rigidly controlled, high coefficients of reliability might be secured. But this suggestion is quite as damning for the work of the past 20 years as are the Kansas findings, for such precautions have never been taken."

New volumes in this field include the following: F. Hemptmann, *Tierpsychologie vom Standpunkte des Biologen*; Neander P. Cook, *Instinct in the Cell and Organism*; Browne F. Balfour, *Concerning Habits of Insects*.

**MENTAL MEASUREMENT, EDUCATIONAL PSYCHOLOGY, ETC.** An attack on the mental age concept was launched by L. L. Thurstone in the *Psychological Review* (vol. xxxiii, 268). Professor Thurstone insisted that the relation between intelligence and age is not a linear one, and that this results in an ambiguity in the application of the term "mental age." Sometimes the term "mental age" corresponding to a specific performance means the chronological age for which the test performance is the average; sometimes the term "mental age" means the average chronological age of people who make that test performance. Professor Thurstone urged the use of percentile standing among children or persons of own age. A special number of the *Psychological Bulletin* (vol. xxiii) was devoted to Educational Psychology and Mental Measurement. The number was edited by Prof. R. Pintner. The writers generally stressed the need for great uniformity and standardization of tests and measurements.

New books dealing with mental measurement and educational psychology include the following: A. D. Inskeep, *Teaching the Dull and Retarded Child*; F. W. Freeman, *Mental Tests*; R. M. Ogden, *Psychology and Education*; Jean Piaget, *The Language and Thought of the Child*; J. J. Strassheim, *A New Method of Mental Testing*; James E. McDade, *Individual Number Drills*; C. E. Benson, J. E. Longen, C. E. Skinnell, and P. V. West, *Psychology for Teachers*; A. S. Neill, *The Problem Child*; Helen T. Wooley, *An Experimental Study of Children at Work and in School*; Bertha M. Boody, *A Psychological Study of Immigrant Children at Ellis Island*; Andrew Wilson Brown, *The Unevenness of the Abilities of Dull and Bright Children*; S. Hollingworth, *Gifted Children*; Harry E. Garrett, *Statistics in Psychology and Education*; H. Eng, *The Emotional Life of the Child*.

**APPLIED PSYCHOLOGY.** The field of applied psychology is too scattered for adequate presentation in a summary. The reader is referred to the volume by C. S. Myers on *Industrial Psychology*, which gives a general idea of the psychological techniques applied to modern business and industry; and also to the special review by M. S. Viteles in the *Psychological Bulletin* (vol. xxiii, 631), which summarizes in an interesting way the results of a number of recent experimental studies.

**ABNORMAL PSYCHOLOGY.** Professor McDougall's long awaited *Outline of Abnormal Psychology* was published this year. It is undoubtedly the best available text-book in the field, if we except Janet's *Principles of Psychotherapy* and *Psychological Healing*, which are translated from

the French and reflect the viewpoint of the French school.

The great merit of the McDougall book is that it avoids extreme theories, such as psychoanalysis and mechanistic behaviorism, and that it gives a common-sense formulation of the facts of abnormal behavior. Dogmatic psychologists who do not have to deal with human conduct in a practical way may insist that mind does not exist, but for Professor McDougall, as indeed for anyone who has to deal with specifically mental problems, mind is real enough. So, too, are the instinctive urges, in terms of the derangement of which we ordinarily have to explain mental aberrations. Sex (taken in the specific sense) is one of these urges, but only a theorist enamored of his system would try to reduce all instinctive urges to the sexual one.

In all such respects the work of Professor McDougall is clear-sighted and constructive. Yet when we turn to the philosophic side of the problem and ask what insight is afforded into the ultimate nature of spirit by the system of abnormal psychology, we are quite disappointed. We find Professor McDougall talking of the interaction of mind and body, without so much as giving a thought to the philosophic difficulty involved. Worse than that, we find him accounting for the disintegration of personality by formulating not merely a dualistic system of mind and body, but a system whereby the human individual is an aggregation of mind-body monads. The author regards it as an improvement over the doctrine of Leibnitz that he puts "windows" into his monads, but to us it would seem quite the opposite; it takes away the whole depth of Leibnitz's conception and reduces the doctrine to the semi-materialism prevalent in common-sense thought.

Prof. H. L. Hollingworth's *The Psychology of Thought* is an attempt to use experimental studies on sleeping and dreaming, for formulating a theory of thought. Also dealing with the problem of sleep is Dr. Joseph Collins' *Sleep and the Sleepless*, which has just been reissued. Recent work in hypnosis is summarized in a special review by Paul C. Young in the *Psychological Bulletin* (vol. xxiii, 504).

The subject of crime and social abnormality in general receives a great amount of attention. *The Journal of Abnormal Psychology* (vol. xxi) carries an editorial on The Need of More Psychological Studies of Crime. In the same issue there appears a paper by W. D. Tait on Crime and Its Causes. The author attributes crime to uncontrolled urgings, and believes that there is no other way out than punishment. This conclusion is in a sense refreshing, for hitherto psychologists in their investigation of crime have gone from the criminal to his psychological constitution, and from that they have gone on to deduce both the uselessness and the wrongfulness of punishment. Perhaps the danger now is that psychologists will be so actuated by the idea of social control as to go to the other extreme and plead for more punishment than even the general public demands.

*The British Journal of Medical Psychology* (vol. vi) carries a noteworthy symposium on The Definition and Diagnosis of Moral Imbecility. The participants in the symposium are A. F. Tredgold, Cyril Burt, M. Hamblen Smith, W. Rees Thomas, and F. C. Schrubbsall.

A number of new works on psychiatry were

published, and of these the following should be mentioned: C. MacFie Campbell, *Delusion and Belief*; and Edward Willys Tyler, *Psychotherapy*.

Other works of interest to students of abnormal psychology are W. S. Taylor, *Readings in Abnormal Psychology*; Carl Murchison, *Criminal Intelligence*; Jesse Q. Stutsman, *Curing the Criminal*; William Healy, *Delinquents and Criminals*; John Lewis Gillin, *Crime and Penology*.

**SOCIAL PSYCHOLOGY.** The rubric Social Psychology is to-day about the most indefinite in the whole science of psychology. The reason for this is to be found in the limited outlook of the general and experimental psychologists, who have sought to reduce everything to physiology and objective data. The science of social psychology was thus invented (as was remarked in a previous review) to fill in what experimental psychology overlooked; and, in point of fact, the subject matter of social psychology, when it is defined at all, includes what most laymen would call psychology. But psychologists, even when they turn to social psychology, carry over the objective experimental method of general psychology, and as a result no specific method has ever been worked out for social psychology. The method of McDougall is much too dogmatic, and the method of the experimentalists much too experimental.

The nearest approach to adequacy of method is to be found in the writings of French psychologists and sociologists. These French writers combine an objective and sociological method with psychological analysis in the classic sense of the term. An illustration of what we have in mind is furnished by H. Delacroix's *L'Analyse Psychologique de la Fonction Linguistique*. The book is a condensation of his much larger work, *La Psychologie du Langage*, published in 1924. The best way to describe its contents and the theories of the author is to say that Professor Delacroix starts with behaviorism, both social and physical, but then traces the complex and unconscious intellectual work which is behind the automatic and reflex acts. Thus in a sense Watson is right when he says that the word "red" is a response to the stimulus of a red color. But if we want to understand how and why people automatically respond with the word "red," we cannot do it by regarding the human individual as a physical mechanism, as Watson would have it, but by retracing the intellectual activity represented by the etymology of the word.

In connection with M. Delacroix's work it is interesting to recall the permanent contributions that have resulted from the school of Durkheim. For this purpose Roger Lacombe's *La Méthode Sociologique de Durkheim* may be recommended.

Passing to American and English studies, mention should be made first of all of L. L. Bernard's *Introduction to Social Psychology*. Professor Bernard is preoccupied with the problem of instinct and reflex action, and combats McDougall's classification. Among the more general monographs are that of R. G. Gordon on *Personality*, and that of Hanbury Hankin on *Common Sense and Its Cultivation*.

The following books, while of an ethnological nature, are of interest to social psychologists: Bronislaw Malinowski, *Crime and Custom in*

*Primitive Society*; L. Lévy-Bruhl, *How Natives Think*; Sir James G. Frazer, *The Worship of Nature*; W. H. Rivers, *Psychology and Ethnology*.

**PUBLIC SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**PUERPERAL ECLAMPSIA.** The treatment of this complication of childbirth has until recently involved forced delivery as the most available means to free the maternal organism of a poison and give the baby a chance for survival. By this means the mortality could be brought down to a certain level—about 20 per cent for mothers. Only in Russia was there a clinic in which opiates were given and expulsion left to itself. The incidence of the disease appears to be falling off somewhat as a result of greater prenatal care, including regular examinations of the blood pressure and urine. For some years back there has been a tendency to make more use of sedatives, especially morphine and sulphate of magnesium, in the attempt to lower the maternal mortality. The fear that the child mortality might increase thereby has not been borne out, for there have been fewer still-births and fewer children have died of secondary mortality soon after delivery. In the *Journal of the American Medical Association* for July 24, Drs. Davis and Harrar report 879 cases of puerperal eclampsia, with many other statistics from the records of the New York Lying-in Hospital. This period extended over 30 years, during which the total confinements amounted to 152,248. In 1922 there were but eight cases in a total of 5400 deliveries, and but one of the eight ended fatally. In 1914 there were 57 cases, while in 1925 the number was 12. Curves show a seasonal factor in the incidence of the disease, for the peak is reached during March-May, while the low mark falls in July.

The deaths in the 879 cases number 203, a mortality of 23 per cent. The worst year was 1905, when there were 150 cases, with 36 deaths. The mortality has since come down to an average of 15 per cent exclusive of cases which develop after delivery, these giving 20 per cent. This lowering of the death rate may be attributed to the recent custom of giving morphine in large doses. Every woman receives half a grain on admission, and after that a quarter grain as required. The only instrumental intervention is the ordinary low forceps to aid in actual expulsion.

In the same number of the *Journal*, Drs. McNeille and Vruwink of the Los Angeles General Hospital report the routine use of intravenous injection of magnesium sulphate as of great value, but rather as a preventive of convulsions than a cure. It brings down the blood pressure and stimulates the functions of the kidney. The mortality under this treatment has fallen from 36 per cent to less than 15 per cent.

**QUACKENBOS, JOHN DUNCAN.** American physician and educator, died at Lake Sunapee, N. H., August 2. He was born in New York City, Apr. 22, 1848, the son of George Payn

Quackenbos, known as the author of a series of textbooks. He graduated from Columbia College in 1868, and from the College of Physicians and Surgeons in 1871. In the previous year he had been appointed tutor of rhetoric and history at Columbia College, and continued in educational work until 1894, when he retired from active service at Columbia University as professor emeritus. In 1884 he had been made adjunct professor of the English language and literature, and in 1891 he had become professor of rhetoric at Columbia University and at Barnard College. On his retirement from active educational work, Dr. Quackenbos devoted himself to the practice of medicine, specializing in mental and moral diseases, with particular reference to hypnotic suggestion and similar methods of treatment. In addition to a number of textbooks, treatises on fish, and various contributions to medicine, he was the author of *Magnhild*, a psychical novel (1919); *Hypnotic Therapeutics* (1908); *Body and Spirit* (1916); and *Rational Mind Cure* (1925).

**QUEBEC**, kwě-běk'. The largest province in Canada, and one of the four original provinces in the present Dominion of Canada; including most of the Labrador peninsula; bounded on the west by Hudson Bay and Ontario, on the north by Hudson Strait, on the east by Labrador, and on the south by New Brunswick, the United States, and southern Ontario. Area, 706,834 square miles; population, according to the census of 1921, 2,361,199, of whom 1,038,128 were rural, 357,295 of British origin, and 1,889,090 of French origin. Capital, Quebec. The chief cities with their populations, according to municipal statistics, are as follows: Montreal, 836,304; Quebec, 116,488; Hull, 35,521; Verdun, 32,804; Three Rivers, 26,000; and Sherbrooke, 24,179.

The provisional figures for the acreage and yield of the most important field crops for the year 1925 were as follows: Wheat, 68,000 acres, 1,210,000 bushels; oats, 1,856,000 acres, 53,638,000 acres; barley, 124,000 acres, 2,976,000 bushels; rye, 13,000 acres, 216,000 bushels; flax, 2700 acres, 29,000 acres; mixed grains, 113,000 acres, 657,000 bushels; other grains, 239,000 acres, 4,903,000 bushels; potatoes, 156,000 acres, 10,982,000 cwt.; roots, 34,000 acres, 3,682,000 cwt.; hay and clover, 4,112,000 acres, 6,703,000 tons; alfalfa, 22,000 acres, 46,000 tons; fodder corn, 90,000 acres, 828,000 tons.

Quebec is the chief Canadian province in the production of pulpwood, having more than half of the Canadian production. The value of mineral production in 1924 was \$18,952,896. The leading minerals were asbestos, mica, cement, sand, and limestone. Total imports for consumption in 1923-24 amounted to \$250,484,108; total exports, \$359,050,554. The revenue for 1924 was \$23,170,733; expenditure \$21,867,293. The public debt in the same year was \$56,638,801. The railway mileage totals 4959.77, exclusive of 321 miles of electric railways. At the head of the government is a lieutenant-governor appointed

by the governor-general of Canada, who acts through a responsible ministry; legislative power is vested in a bicameral body, a council of 24 members, who are appointed for life, and a legislative assembly of 85 members elected for five years. Quebec is the only province in Canada in which women are not enfranchised or eligible for election to the legislature. Lieutenant-Governor at the beginning of the year, N. Pérodeau; Premier, Attorney-General, and Minister of Municipal Affairs, L. A. Taschereau; Lands and Forests, Honoré Mercier; Treasurer, J. Nicol; Secretary, Athanase David; Agriculture, J. E. Caron; Colonization, Mines and Fisheries, J. E. Perrault; Public Works and Labor, A. Galigneault; Roads, J. L. Perron; Ministers Without Portfolio, E. Moreau, M. Madden, and L. Lapierre.

**QUEENS COLLEGE.** A college for women at Charlottetown, N. C.; founded in 1771; non-sectarian in purpose, but under the direction of the Presbyterian Church. The enrollment for the autumn of 1926 was 330. There were 30 members in the faculty, of whom an associate professor in religious education, an assistant in the science department, and an assistant in mathematics and Latin, were added in 1926. The college had a yearly income of \$200,000. The library contained 8395 volumes. A new building, costing \$80,000, combining refectory and dormitory space, was proposed for 1927, in order to increase the number of students who could be accommodated. President, William H. Frazer, D.D.

**QUEENSLAND.** A state in the Commonwealth of Australia, situated north of New South Wales; the second largest of the constituent Australian states. Area, estimated at 670,500 square miles; population, according to the census of 1921, 755,972; estimated, Mar. 31, 1926, 867,643, of whom 458,120 were males and 409,523 females. The movement of population in 1925 was: Births, 20,283; deaths, 7545; marriages, 6471. The immigrants in the year 1924 numbered 92,871 and the emigrants, 83,376. Capital, Brisbane, with a population in 1924 (10-mile radius), of 245,015.

During 1924 there were 1688 state schools (including 13 high schools and 152 provisional schools) with 4122 teachers and an average daily attendance of 104,283. The total value of all crops in 1924 was £13,992,384 as compared with £10,105,844 in 1923. The principal crops are green fodder, sugar cane, corn, wheat, cotton, hay, and bananas. The total value of the mineral production in 1924 was £2,266,461. Since the discovery of the gold fields in 1858 the value of the gold output, to the end of 1924, was £84,993,461. Coal is also an important mineral product (1,123,127 tons produced in 1924), and among the other mineral products are copper, tin, wolfram, lead, cobalt, etc. In 1924-25 the imports amounted to £12,833,375 and the exports to £24,454,616. The registered shipping in 1924 consisted of 150 sailing vessels of 6388 net tons and 113 steamers of 25,942 net tons. On June 30, 1924, 6040 miles of railways were open, of which 5964 were being worked.

The annual report of the Commissioner of Railways in Queensland, for the year ended June 30, 1926, showed that the gross railway earnings were £7,437,090, as compared with £7,109,210 in the previous year. Deducting working expenses of £6,459,792 as compared with £5,425,167 for the previous year, this has left a net

revenue of £977,298 as compared with £1,684,043 in the preceding year. Interest on capital amounted to £2,770,052, as against £2,578,541, thus producing a deficit of £1,792,754 as against one of £894,498 in the previous year.

Executive power is vested in a governor, who acts through a responsible ministry; and legislative power in a single chamber or legislative assembly of 72 members elected for three years (the legislative council was abolished in 1922). The governorship at the beginning of the year was vacant. Lieutenant-Governor, W. Lennon; Prime Minister, W. McCormack.

**QUESTIONNAIRE METHOD.** See PSYCHOLOGY.

**QUICKSILVER.** During 1926 the consumption of quicksilver in the United States continued at the same high rate as in 1925, and it was estimated that the domestic production plus the imports would show an apparent consumption of about 34,000 flasks of 75 lbs. each for the eleven-month period ending Dec. 1, 1926. In continental Europe there was an increased consumption, especially in Germany, but in England the unsettled industrial conditions acted against any further increase. It was believed that both Spain and Italy were increasing their production and Spanish production was believed to be the heaviest on record. The production of the United States in 1926 was estimated at 10,000 flasks, as compared with 9174 flasks, valued at \$762,610, in 1925; that of Mexico and miscellaneous countries, 3500 flasks; while that of Spain was stated at 46,000 and Italy at 52,000, making a total estimated production for the year of 111,500 flasks. At the end of the year there was no apparent stock on hand, so that it was believed that consumption was equal to production. In both Italy and Spain the old mines were being worked, while in the United States, in addition to the mines where production had taken place in the past, there were several new prospects in Washington, Oregon, Nevada, and Arizona. In California the old mines did most of the production, but in one a new furnace plant was installed and at the end of the year it was stated that over 20 mines or prospects were opening up and developing in California. In Oregon a considerable number of furnaces were installed, in addition to small mines and prospects being worked, while in Nevada old mines were being opened and new prospects were being developed. In Arizona also there was increased activity and in December it was believed that production would be increased during 1927. In the annual review published in the *Engineering and Mining Journal* (New York), it was stated that nearly 95 per cent of the world's quicksilver was produced in the six largest mines, four of which were in Italy, one in Spain, and one in the United States, the last named being the smallest producer of the six.

The imports of quicksilver in 1926 totalled 2,146,076 pounds, valued at \$1,936,458, as against 1,708,560 pounds, valued at \$1,321,586, in 1925. California, in 1925, produced 83 per cent of the total of 9174 flasks, while Texas, Nevada, Arizona, and Idaho contributed 1560 flasks.

**RACIAL STUDIES.** See ANTHROPOLOGY.

**RACING.** No international competition marked thoroughbred racing in 1926, but the more important meetings throughout the United States, Great Britain and France attracted their customary widespread interest. It was estimated

that the wagering on horse races in England alone during the year amounted to more than \$1,500,000.

In the United States, the three-year-old division proved preëminent, the leading horse being Crusader, owned by Samuel D. Riddle. Crusader captured nine purses, totalling \$106,033, a worthy record for a son of the great Man o' War and Star Fancy. Numbered among Crusader's triumphs were the Belmont, Riggs Memorial, Cincinnati Derby, Dwyer Stakes, Havre de Grace Handicap, Jockey Club Gold Cup, and Suburban Handicap. Harry Payne Whitney again was the largest money winner among the owners, with a total of more than \$400,000. Ranking second to Crusader as a purse winner was Boot to Boot, owned by Colonel Bradley. The champion filly of the year was W. R. Coe's Black Maria. There was a scarcity of good two-year-olds, perhaps the best among them being the Foxcatcher Farm's Fair Star and W. M. Jefford's Scape Flow. The leading jockey was Laverne Fator.

The winners of the principal turf events in the United States were as follows: Futurity, Scape Flow; Preakness, Display; Kentucky Derby, Bubbling Over; Hopeful, Lord Chaucer; Belmont Stakes, Crusader; Withers, Haste; Saratoga Special, Chance Shot; Travers, Mars; Suburban Handicap, Crusader; Metropolitan Handicap, Sarazen; Saratoga Cup, Espino; Brooklyn Handicap, Single Foot.

Coronach, owned by Lord Woolavington and ridden by J. Childs, won the English Derby by five lengths. W. M. Singer's Lancegaye finished second, Lord Derby's Colorado third and Lord Astor's Swift and Sure fourth. The Grand Prix de Paris was captured by Take My Tip, owned by James Hennessy, with Simon Guthmann's Biribi second.

The first running of the Hambletonian Stake was the feature of 1926 in harness racing. This stake had a gross value of \$75,000, the richest purse ever put up for trotters. The winner was Guy McKinney, a three-year-old colt, owned by H. B. Rea and driven by Nat Ray. Highland Scott carried off the honors in the three-year-old pacing division. A new world record for four-year-old trotting geldings, 2:02 1-4, was set by Guy Ozark, owned by E. Roland Harriman, at Toledo, Ohio. The winning driver of the year was Walter Garrison.

**RACQUETS.** Outstanding events in the world of racquets during 1926 were the retirements of Jay Gould, for twenty years United States national amateur court champion, and Walter Kinsella, world's open squash champion, and the defeat of Clarence C. Pell, who had stood at the head of amateur racquets for 11 years. C. Suydam Cutting of New York City acquired the national amateur court honors through the default of Gould by reason of the latter's poor physical condition. Kinsella's title went to Francis Ward of New York City, and Stanley Mortimer defeated Pell in the racquets singles final.

Fillmore Van S. Hyde of the Harvard Club, New York, regained the amateur squash tennis championship from William Rand, jr., also of the Harvard Club, who had defeated Hyde in 1925. W. Palmer Dixon won the national amateur squash racquets championship.

**RADCLIFFE COLLEGE.** A non-sectarian college for women at Cambridge, Mass.; founded in 1879. The enrollment for the autumn of 1926 was

1024, distributed as follows: regular students, 727; graduates, 257; special students, 40. Instruction is given to the students of the College by 179 teachers from Harvard University. The productive funds amounted to \$3,432,000, and the income for college purposes to \$400,000. The library contained 54,952 volumes, exclusive of pamphlets. President, Ada Louise Comstock, A.M., Litt.D., L.H.D., LL.D.

**RADIO.** See U. S. DEPARTMENT OF AGRICULTURE.

**RADIO BROADCASTING.** More broadcasting stations, greater variety of programmes offered, and continued interest by many in the construction of their own receiving sets combined to make 1926 a record year for the manufacturers and distributors of parts as well as of complete sets. A conservative estimate of the amount of sales of radio apparatus and parts during the year put the figure at \$520,000,000.

New discoveries and inventions for the improvement of radio transmission and reception were numerous. There was further investigation of the value and limitations of short-wave transmission. One of the most valuable results of the work of radio engineers was the development of "beam transmission" by Marconi, whereby not only greater range of signaling was secured, but transmission over a given distance could be accomplished with the expenditure of a smaller amount of power. Scientists were actively engaged in studying static, fading and other troubles commonly experienced in reception of radio signals. Dr. J. H. Dellinger, Chief of the Radio Laboratory of the U. S. Bureau of Standards, stated that:

The results all tend to corroborate the hypothesis which was conceived a few years ago of the effect of an upper conducting layer in the earth's atmosphere. This upper conducting layer, called the Kennelly-Heaviside surface, has now been located.

Its height is found to vary at different times of year and day all the way from fifty to five hundred miles above the earth's surface. The action of this conducting or reflecting surface explains the enormous distances of transmission at night and on high frequencies.

This knowledge is placing radio transmission on an engineering basis and makes it possible to calculate definitely the service that can be obtained from a given transmitting station. The advantage of this work is especially marked in connection with the high frequencies or short waves. High frequency waves are particularly erratic, but as a result of the investigations of their behavior it is now possible to take full advantage of their tremendous carrying power.

At the close of the year 116 new broadcasting stations were under construction in the United States, and the Department of Commerce received notice of 203 additional undertakings of the same sort upon which work was expected to begin. Early in the year, it was reported upon reliable authority that there were 575 broadcasting stations in the United States, more than five times the number in all European countries.

The activity in this line of electrical manufacture was reflected in export sales in increasing quantities. During 1925, according to bulletins issued by the U. S. Department of Commerce, the value of radio equipment exported from the United States was \$9,903,857, going chiefly to Canada, Latin America and Asia, although European countries absorbed \$1,497,532 worth of radio material and the United Kingdom \$644,900. During the same period, exports of British made radio goods amounted to \$6,496,532, sent mostly to Europe, Africa and Oceania.

Canada purchased from the United States more than \$3,500,000. During the calendar year, 1926, there were exported from the United States 69,482 receiving sets, valued at \$2,873,676; 664,915 tubes, valued at \$867,631; receiving set components to the value of \$2,016,466; and receiving set accessories valued at \$2,481,040.

One of the achievements of the year of great value to commerce was the daily broadcasting from Arlington Station of weather information. Although very few ships were provided with the necessary receiving apparatus, it was expected that the great value of this service to vessels at sea would soon cause wider introduction of the equipment required.

The question of supervision and control of broadcasting in the United States was in an unsatisfactory and unsettled state at the close of the year. The Attorney-General having decided that the necessary powers to license, assign wave lengths, etc., were not vested in the Secretary of Commerce, several bills were introduced in Congress aiming to set up a regulatory committee or body that would be fully empowered to take charge and control such matters. The radio public, scientists, engineers and manufacturers were deeply concerned with the outcome of this discussion, but considerable time would be required to come to an agreement that could be enacted by both Houses of Congress.

Although primarily for the entertainment of travelers on long journeys, several railways were making a study of radio reception on moving trains with a view to possibly making use of it in regular operation. The Canadian National Railways had fifty cars on their transcontinental passenger trains equipped with radio receiving apparatus. Continuous records of reception were kept, so that on the 3700-mile stretch from coast to coast, valuable information was obtained. Excellent reception was usually secured during the day and until midnight; except during a short time in October last, when almost all radio transmission in northern latitudes was seriously interfered with by the prevalence of aurora borealis. The railway maintained ten broadcasting stations between Moncton, N. B., and Vancouver, B. C.

During the year the Canadian Government received fees from 146,186 owners of radio receiving sets and it was estimated that this figure represented only one-half the actual number of sets in use. The total number of radio sets in use was estimated to be more than 5,000,000.

**RADIO FOG SIGNALS.** See LIGHTHOUSES.

**RADIO TELEGRAPHY AND TELEPHONY.** The outstanding feature of progress during the year was the completion of arrangements by the British Post Office and the American Telephone and Telegraph Company for radio telephonic transmission between London and New York. Early in 1926, conversation between these cities was made possible and a long and exhaustive series of tests by the engineers under all sorts of conditions demonstrated that voice transmission between England and America was commercially practicable. At the close of the year it was announced that radio telephone service between New York and London would be available to the public beginning Jan. 7, 1927, at the rate of \$75 for three minutes' conversation and \$25 per minute for each additional minute.

There were many new and unusual features about this transmission. In the United States,

the transmitting station was at Rocky Point, Long Island, N. Y., from which the transmission was received at Wroughton, England. The British transmitting station was at Rugby, 85 miles from London, which transmitted to Houlton, Maine, thence by wire telephone to New York City. The apparatus necessary to equip the various stations for transoceanic service was said to have cost about \$5,000,000. The wave length employed was 5000 meters and a novel feature of the installation was a supplementary short wave transmitter at Deal Beach, New Jersey and a corresponding short wave receiver at London. When a person talked into a telephone transmitter in New York, the long wave transmitter at Rocky Point and the short wave transmitter at Deal Beach operated simultaneously. Experience showed that at certain times during the day, reception at London was better on 22 meters than it was on the 5000 meter wave length.

For radio telegraph signals, satisfactory transmission with low power apparatus was obtained with the so-called "beam system," originally developed by Marconi. By this system, the radiations from a sending station were concentrated and sent out into space like the rays from a searchlight. They could be directed as an intense beam approximately fifteen degrees wide, thus furnishing a much more powerful signal than if allowed to spread out in every direction. A special radiating system of aërials was built in order to direct the radiations to the desired point. Stations were built at Bodmin, England, and Bridgewater, Canada, and satisfactory communication was obtained on short wave length, with only twenty kilowatts of energy at the sending station. This system was especially adapted to wireless telegraphy, but not to broadcasting.

**RADIUM.** During 1926 the radium industry continued in the hands of the Belgian refiners who were understood to have so much of the material on hand that it was not necessary for them to operate either their African mines or their factory. In the United States little if anything was done during the year in the isolation of radium and the only radium-uranium ores recorded mined were for the purpose of making various types of apparatus largely of a medical nature.

fatal injuries than in 1924, although the number of fatalities increased by 149. In 1925 there were 47,949 train and train-service accidents, resulting in 6304 deaths and 47,993 injuries, as compared with 69,197 accidents in 1924, with 6215 fatalities and 48,371 injuries. The averages for the nine years, 1916-24, were 7256 persons killed and 57,181 injured. Although in former years the number of accidents had been influenced by the number of locomotive miles, there were fewer accidents in 1925, although the locomotive-miles increased by 1.5 per cent over 1924.

There were, during the year, 20,785 train accidents where more than \$150 damage to railway property was involved and which were classified as collisions, derailments, locomotive-boiler accidents, other locomotive accidents, and miscellaneous train accidents. This was 1583 less than were reported for 1924, and was accompanied by a decrease of 74 injuries but an increase of 51 fatalities. Negligence of employees, as in 1924, was the cause of the greatest number of casualties in train accidents, with 174 fatalities and 2026 injuries, while 21 fatalities and 292 injuries were due to defects in, or failures of equipment, although there were 8186 accidents due to defects of equipment and only 6280 due to negligence of employees. The total amount of damage to railway property as a result of train accidents in 1925 was \$22,149,457, or \$1,176,523 less than in 1924. Of this amount, \$8,318,435 damage was caused by defects in or failures of equipment.

There was a slight increase in the number of casualties in train-service accidents, or those resulting in reportable casualties but not in damage to railway property in excess of \$150, and including accidents to employees such as due to coupling locomotives, operating switches, etc., accidents at grade crossings, struck or run over elsewhere, and miscellaneous, the number of fatalities in this group being 5946, as against 5848 in 1924, but the injuries were 44,081, or 304 fewer than in the preceding year.

The number of accidents at grade crossings increased in spite of efforts of railroads and other agencies to lessen their number, there having occurred 5479 in 1925, as compared with 5127 in 1924. The accompanying table gives a comparison of grade-crossing accidents for 1925, 1924, and 1923.

Year	Total		Train accidents		Train-service accidents	
	Killed	Injured	Killed	Injured	Killed	Injured
1925.....	2,206	6,555	50	69	2,156	6,486
1924.....	2,149	6,525	61	164	2,088	6,361
1923.....	2,268	6,814	22	107	2,246	6,207

**RAILWAY ACCIDENTS.** In the year 1925 there were 6766 persons killed and 137,435 injured in reportable accidents on steam railways in the United States, according to Accident Bulletin No. 94 of the Bureau of Statistics of the Interstate Commerce Commission published in 1926. This bulletin contains statistics regarding collisions, derailments, and other accidents occurring in 1925, which resulted in injury to persons, equipment, or roadbed, and which arose from the operation of steam roads used in interstate commerce. These figures include 402 fatal and 89,442 non-fatal injuries resulting from non-train and industrial accidents. The record for 1925 continued to show improvement over preceding years, there being 6304 fewer non-

The table on page 634 summarizes the accidents for 1924 and 1925.

**RAILWAYS.** Economies in operating costs, higher standards of maintenance, and improvement in service, were the three notable features in the history of railroads in the United States in 1926. The two latter, improvement in service and high standards of maintenance, are usually found together, but a combination of much more economical operation with these two has been rarer. It would appear that in 1926 an important advance, amounting almost to a new discovery, was made in the economics of American railroad operation. The development of a heavy train load has generally been considered one of the outstanding achievements of the science

of railroad operation as developed in America. This has not always, or even generally, made for the best service to the public. A steam locomotive can haul the heaviest load which it is capable of hauling, at a comparatively low speed per hour, depending somewhat, of course, on the type of locomotive. With the types in use on American railroads, an average speed of about eight miles an hour was considered to haul the heaviest train load. Furthermore, in territory in which a comparatively small amount of freight traffic originated, cars were frequently held for days or weeks until a sufficient number of them were on hand to fill out a long, heavy train. The time element was neglected in an over-insistence on the element of weight. In 1926, however, railroad managements generally gave the time element its fair share of consideration.

A measure of railroad operation which combines the two elements is the figure for net ton-miles per train-hour. Thus, if the train load is 400 tons and the average speed is 10 miles per hour, the net ton-miles per train hour will be 4000. If either the speed or the weight of the train is doubled, the other factor remaining the same, the net ton-miles per hour are doubled, viz., 8000. In August, 1926, the average net ton-miles per train-hour on railroads in the United States was 9867, comparing with 9426 in August,

1925, and the average net ton-miles per train-hour in the first 10 months of 1926 were 9259, and for the corresponding 10 months of 1925 were 8822.

This was the result both of an increase in train load and an increase in the average speed. The average train load for the country by months in 1926 varied from 720 tons to a maximum of 829 tons, whereas in 1925 the train load varied from a minimum of 709 tons to a maximum of 796 tons. The highest average speed was in May, 1926, and was 12.4 miles per hour, and for the first 10 months of 1926 averaged 12 miles per hour.

Another way to measure speed is to record the miles run by a locomotive in a day. The average miles run per locomotive in October, 1926, was the highest in the history of American railroads, 67.5 in a day. The highest average in the five years, 1921 to 1925 inclusive, in one month, was 61.3.

Notwithstanding the higher speed, fuel consumption per thousand gross ton-miles was reduced to 121 lbs., in July and August, 1926, as against 126 and 125 lbs., respectively, in July and August, 1925. This was for freight service. In passenger service, fuel consumption was reduced to 14.3 lbs. per passenger car mile in July and August, as compared with 14.8 and

14.7, respectively, in the corresponding months of 1925. To some extent this improvement may have been the result of a better design of locomotive and more complete combustion of fuel, but it is believed, from actual observation, that it was largely due to better methods of firing locomotives. Firemen distributed a shovelful of coal more evenly and used better judgment in feeding the fire. In other words, this class of railroad labor was more efficient, due to better training and better supervision. This was true in other departments of railroad operation as well.

There were 1,730,171 men employed in railroad work in January, 1926, according to the Interstate Commerce Commission's statistics, and 1,728,333 employed in January, 1925, and 1,749,927 employed in January, 1924. Thus, with an increase of 32,000,000,000 ton-miles of freight carried, or 7 per cent in 1926 as compared with 1925, there was an increase of only about 2000 employees, or a fraction of 1 per cent in the number of employees. There are various ways by which improvements in freight service are indicated, one of the best being the reduction in freight claim payments. In 1926 freight claim payments amounted to approximately \$32,000,000. This compares with \$40,000,000 in 1925 and \$120,000,000 in 1920. Both President Coolidge and Secretary Hoover of the Department of Commerce have commented upon the improvement in railroad service. President Coolidge in a message to Congress in the latter part of 1926 said:

It would be difficult to conceive of any modern activity which contributed more to the necessities and conveniences of life than transportation. Without it our present agricultural production and practically all of our commerce would be completely prostrated. One of the larger contributing causes to the present highly satisfactory state of our economic condition is the prompt and dependable service, surpassing all our previous records, rendered by the railroads. This power has been fostered by the spirit of coöperation between Federal and State regulatory commissions.

Secretary Hoover in his annual report said:

The railways, during the past five years, not only have built up adequate service and given a complete correction to these ills, but they have, by great ability of their managers, greatly reduced transportation costs and thus made rate reductions possible which would not have been otherwise the case. . . . Rapid dispatch has greatly reduced the inventories of the country, has contributed to the stabilization of production and employment, and has increased the efficiency of all production and distribution.

As regards improvement of the physical property of the railroads, a comparison of maintenance-of-way expenditures in the first quarters of 1926, 1925 and 1924 may be made by means of the figures compiled by the Interstate Commerce Commission. With an increase of only 1 per cent in total operating revenues, the railroads spent 8.9 per cent more for maintenance of way. While there may be individual exceptions, the following statement is believed to be true as regards the railroads as a whole: They were less in need of heavy maintenance expenditures Jan. 1, 1926, than they were on Jan. 1, 1924. The more liberal policy adopted in 1926 was probably not dictated by necessity but by ability to spend more money on upkeep and by desire to establish a better transportation machine and thus to reduce the future necessary expenses of both maintenance and operation. . .

Few people realize how great variance may be made in maintenance-of-way expenditures as

a matter of arbitrary policy. On a well maintained railroad it would be possible to cut down maintenance-of-way expenditures by more than 25 per cent for a year, or, in some cases, for a longer period. In the long run, of course, rehabilitation of the property would cost far more than the apparent saving made arbitrarily in the one year.

On the other hand, a road may be in fairly good physical condition, and yet maintenance expenditures may be barely enough to keep it in this condition, and an increase of 10 per cent in the amount appropriated for maintenance expenditures may conceivably put the road in first-class condition and leave a margin of safety for times of lean earnings that will be a strong factor in the credit position of the railroad company's common stock. Apparently, the railroad managements generally have taken the opportunity afforded by relief from the strain attendant on the resumption of private operation and the uncertainty as to the attitude of national and State legislatures, to improve as well as fully maintain their properties.

Expenditures for maintenance of equipment show a decrease of nearly 3½ per cent in the first quarter of 1926, as compared with 1924. Maintenance of equipment allows of no such arbitrary variation in policy as is the case with maintenance of way. Equipment has to be repaired, or else it quickly becomes unserviceable. It is, of course, possible for a very short period of time to neglect repairs of cars and locomotives, but the results show themselves within a few months in increased cost of operation if traffic keeps up. The neglect is easily discoverable by any one who will take the trouble to examine the weekly reports of the American Railway Association in regard to car and locomotive conditions. The number of freight cars in unserviceable condition January, 1924, was 6.7 per cent and January, 1926, was 6.6 per cent of all cars on line, and the number of freight locomotives in unusable condition January, 1924, was 19 per cent and January, 1926, was 17 per cent of the total on line, and the number of passenger locomotives unserviceable January, 1924, was 18.3 per cent and January, 1926, was 17.1 per cent of total passenger locomotives on line.

The decrease in expenditures for maintenance of equipment largely indicate, it is believed, economies effected in the mechanical department of the railroads. This department was specially demoralized during the period of Government operation, but conditions were made still worse by the strike of railway shopmen in 1922; the aftermath of the strike was a considerable period of unduly high expenditures for repairs to cars and locomotives.

*Railway Age* makes an annual compilation of railroad statistics showing the amount of new railroad construction, building of new cars and locomotives, financial changes, etc., and the following figures are taken from its annual statistical number: The total number of miles of first track built in United States in 1926 was 1005, as compared with 644 in 1925. Of this, 242 miles were new lines built in Texas, in large part by the Southern Pacific, and 233 miles of new lines were built in Florida largely by the Seaboard Air Line Railway. Arizona was the only other state in which more than 100 miles of first track was built, and here the Southern Pacific did the building and completed

145 miles. The number of miles of railroad abandoned in the United States in 1926 totalled 457 as compared with 606 in 1925.

There were 1301 locomotives ordered for domestic service in the United States in 1926, as compared with 1055 ordered in 1925 and 1413 in 1924. These, it will be noted, are orders for new business, and are not a measure of the output of locomotive builders' plants. The number of locomotives built for domestic service in 1926 was 1585, as compared with 994 built in 1925. This includes in both cases Canadian production. These figures for locomotives ordered and built, as well as the figures quoted below for cars ordered and built, are arrived at by *Railway Age* with the greatest possible care, but, since questionnaires have to be sent to a great many different persons, there are probably slight inaccuracies or inconsistencies, due to different interpretations placed upon some questions by different men.

The new departure in locomotive design, of building three-cylinder engines, beginning after the War, was continued in 1926. Thus, the American Locomotive Co. built a three-cylinder 4-12-2 type of locomotive for the Union Pacific, and the Baldwin Locomotive Works built a three-cylinder compound high-pressure locomotive which was exhibited at the American Railway Association convention in June at Atlantic City. By "4-12-2 type" is meant a locomotive which has four wheels on the forward truck, twelve driving wheels and two trailing wheels under the cab.

As in the case of locomotives, it is necessary to distinguish between cars ordered and cars built. In 1926 *Railway Age* estimated that orders were placed for 67,029 freight cars as compared with 92,816 freight cars ordered in 1925 and 143,728 ordered in 1924. There were 1495 freight cars ordered for use in Canada in 1926, and 1971 ordered for export to other countries. This compares with 642 freight cars ordered for Canada and 2138 freight cars ordered for export in 1925.

The number of freight cars built in 1926 was estimated at 88,862, and compares with 105,934 built in 1925 and 113,761 built in 1924. The following figures are for an all-steel hopper car built for the Chicago and Eastern Illinois by the Mount Vernon Car and Manufacturing Co.:

Capacity 70 tons  
Weight empty 56,400 lbs.  
Length inside 39 ft.  
Length outside 39 ft. 8½ in.  
Cubic capacity 2,590 cu. ft.

Of passenger cars ordered for service in the United States and Canada and for export, there were 2162, comparing with 2317 in 1925 and 2679 in 1924. The total number of passenger cars built in the United States in 1926 was 2286 and in Canada 285, making a total in the two countries of 2571, comparing with 2380 built in 1924.

There were more miles of automatic block signals installed in 1926 than in any year for which the Interstate Commerce Commission or *Railway Age* has any record. Automatic block signals were installed on 4993 miles of road in the United States and Canada during 1926, comparing with 1758 miles equipped with automatic block signals in 1925. There were only 100 miles of road equipped with manual block signals.

During 1926 there were only two railroad

companies that went into receivers' hands, and one of these had only 40 miles of railroad, while the other one had not been completed and was not in operation. *Railway Age* records for receiverships extend back to and include 1876, and for number of companies and mileage 1926 was the lowest during this entire period. The next lowest was 1901, with four companies placed in the hands of receivers, operating 73 miles of railroad. The year showing the greatest number of receiverships or companies, and with the largest mileage, was 1893, with 74 companies and 29,340 miles of road. In 1925 there were five companies, operating 11,130 miles of road (this includes the Chicago, Milwaukee and St. Paul.) For an account of the receivership of the Chicago, Milwaukee and St. Paul, see the 1925 YEAR BOOK.

Again using *Railway Age* figures: It was estimated that up to Dec. 26, 1926, the par value of all railroad financing was \$446,013,200, of which \$236,954,000 was the sale of bonds; \$167,482,000 the sale of notes; and \$41,577,200 the sale of stock. The most noteworthy financing through the sale of railroad company stock was that of the Southern Railway, which sold \$10,000,000 common stock to its own stockholders, and that of the Atlantic Coast Line, which sold \$13,756,580. The Southern Railway is mentioned first because up to a few years previously the company's earnings and credit were such that it could only sell bonds at a comparatively high cost in interest rate, and its ability to sell stock at par was an outstanding achievement in rehabilitation of a railroad company's credit.

The change in a railroad company's dividend rate which aroused the widest public interest was the increase in the annual rate of dividend of the Pennsylvania Railroad Co., stock from 6 per cent to 7 per cent. Other important changes were Baltimore and Ohio, which increased its annual dividend rate from 5 per cent to 6 per cent, and an extra dividend of 3 per cent was paid on Norfolk and Western common in addition to the regular 7 per cent rate. Missouri, Kansas and Texas preferred Series "A" stock was put on a 6 per cent annual dividend basis, and the annual dividend rate of the Chesapeake and Ohio was raised from 4 per cent to 8 per cent, and in addition there was an extra dividend of 4 per cent declared, making a total of 12 per cent in 1926.

In September, 1926, the Interstate Commerce Commission which, under the provisions of the transportation act, has jurisdiction over the issuance of railroad securities, refused its approval to the issue of \$4,665,000 4½ per cent equipment trust certificates of the Illinois Central Railroad, and ordered the railroad company to ask for competitive bids. The proposed sale was to the regular bankers of the Illinois Central, Kuhn, Loeb & Co., of New York. The original bid price was 98.43. The railroad company, therefore, asked for competitive bids from other bankers, and received a bid from Halsey, Stuart & Co., of Chicago, of 98.815. This bid was approved by the commission.

The commissioners, in approving of the issue of \$2,670,000 4½ per cent equipment trust certificates of the Western Maryland Ry., at the highest price offered by nine competing bidders, indicated that in the case of equipment trust certificates, at least, they desired to see the railroad companies ask for competitive bids.

In the financing of American railroads certain practices have developed, and asking for competitive bidding is counter to these practices. The theory on which railroad executives and financiers have proceeded is that a railroad company in the long run gets its money more cheaply, and is better able to get new money or to refund maturing issues, by dealing with one banking house or group of banking houses. Thus, railroads were classified as Morgan roads, Kuhn, Loeb roads or Speyer roads, as they did their financing through J. P. Morgan & Co., Kuhn, Loeb & Co., or Speyer & Co. Banking houses such as these are known as houses of original issue, and there are only a few of them in the United States. The argument ran that a continuing relationship with the same banker permits of a consistent and economical plan of financing, and since the banking house takes a definite responsibility when it sells the securities of a railroad company to its own customers, it will be inclined to undertake to furnish money to a road which is temporarily in financial straits or is temporarily showing poor earnings. The theory would appear to be correct, and such a procedure is economically sound so long as the banking house performs its functions in good faith.

In the case of the receivership of the Chicago, Milwaukee and St. Paul Ry. Co., in 1925, bankruptcy was caused by the failure of the railroad company's regular bankers, Kuhn, Loeb & Co., and the National City Co., to undertake to refund about \$40,000,000 of bonds which were due June 30, 1925. Here, because of the unwritten law that a railroad company must not shop around with its securities, but must deal exclusively with its regular bankers, the failure of the banking houses to attempt to sell bonds in order to pay the issue that was due resulted in hardship to the holders of hundreds of millions of securities, both junior bonds and stock. The reasons given for the refusal to undertake the financing was that the fixed charges of the Chicago, Milwaukee and St. Paul were higher than could be earned regularly under the conditions that now exist in the Northwest.

The Interstate Commerce Commission was carrying on an exhaustive investigation into this receivership, and this fact may or may not have had some influence in the commission's determination to make a start toward requiring competitive bidding.

It was probable that the commission still had an open mind as regards competitive bidding, since it approved an issue of \$11,336,000 equipment trust certificates of the Seaboard Air Line Ry. Co., to Dillon, Read & Co., the road's regular bankers, without laying great stress on competitive bidding. The road asked for bids from other bankers, but accepted the bid of its own bankers on the ground that, taken from a broader point of view than that of price alone, the bid was the most advantageous one received.

The total cost of the equipment was \$11,336,000, which was the face value of all the equipment trust certificates issued against it. It is customary, in the issuance and sale of equipment trust certificates, for the railroad company to put up about 20 per cent of the total cost of the equipment in cash and raise the remainder through the sale of the certificates. This, of course, gives the certificate holders an immediate cash equity of 20 per cent, which is further

increased as the equipment trusts are paid off serially each six months. The Seaboard Air Line Ry. had been using its cash to rehabilitate its property, after paying bond interest, and it was not, therefore, in a position to put up a 20 per cent cash equity.

During the period of Federal control, the Government purchased equipment for the roads which it was operating, and issued equipment trust certificates which were divided between prior-lien certificates and subordinate-lien certificates. With the stronger roads, it was found that both prior-lien and subordinate-lien equipment trust certificates could be sold to the public. The Seaboard Air Line Ry., with this as a precedent, divided the \$11,336,000 equipment trust certificates into two parts, \$9,060,000 being 4½ per cent first (prior) lien certificates and \$2,276,000 second (junior) lien certificates, and Dillon, Read & Co., the bankers, bought both issues, thus conserving to the company its cash.

The Interstate Commerce Commission, in adopting the attitude that it did in regard to the Seaboard equipments, apparently gave recognition to the fact that it can function most effectively both for the protection of purchasers of railroad securities and for the protection of the railroads—which of course means railroad stockholders—by taking into consideration the broad questions of the whole financial and operating problems which face a railroad management. By conserving the Seaboard's cash the company was able to install automatic block signals, which is an important factor of safety for the traveling public, replace wooden bridges with steel bridges, and make other additions and betterments which tended toward better service and more economical operation of the road. Such expenditures can, of course, be capitalized, and later the Seaboard will have the right to draw bonds against such capital expenditures and to sell them, thus reimbursing itself, but it would have been expensive to do this at the very time that it was offering to investors over \$11,000,000 of equipment trust certificates.

It would appear, therefore, that this action on the part of the commission was significant and of great importance, and if it marks a step toward closer coöperation between railroad financiers and the Interstate Commerce Commission it may well be one of the very important events affecting the railroads which took place in 1926.

On Mar. 2, 1926, the Interstate Commerce Commission refused the application of the New York, Chicago and St. Louis to acquire and consolidate the Chesapeake and Ohio, Hocking Valley, Erie, and Pere Marquette. The majority decision held that as a matter of public interest and general economies the consolidation was desirable, but in substance held that the methods used to bring about the consolidation were not fair to security holders and not of the type to which the commission would give its approval. In outline, the method adopted was that of purchase of a controlling block of stock in the case of the Chesapeake and Ohio and the Hocking Valley, and the election of directors in sympathy with the merger plans; and in the case of the Pere Marquette and the Erie, obtaining the consent of the necessary number of directors by negotiation with this comparatively few number of men. The directors of the various companies voted to approve of the lease of the

Chesapeake and Ohio, Hocking Valley, Erie and Pere Marquette to the New York, Chicago and St. Louis. The offer was then made to the stockholders of these companies to exchange their securities for securities in a new company which would control the operation of all of the properties.

The Interstate Commerce Commission was particularly emphatic in its condemnation of the methods used by the Van Sweringens, who were in control of the New York, Chicago and St. Louis, to force minority stockholders to deposit their securities under the plan of consolidation. These methods were similar to those of a collection agency where the delinquent first receives only a moderately polite request that he remit, followed, in case he does not remit, by a stern and somewhat threatening letter, after which the debtor receives a personal call from a high-powered collection agent whose business it is to inspire a sufficient amount of fear in the debtor to move him to make a payment. Similarly, the holder of Pere Marquette or Chesapeake and Ohio minority stock would receive a series of letters and a similar suggestion of intimidation. The Interstate Commerce Commission refused to approve such methods. Very little progress was made toward the actual consummation of consolidations. The Interstate Commerce Commission denied the application for the proposed lease of the Virginian Ry., to the Norfolk and Western on the ground that it would not be in the public interest. The Kansas City Southern asked permission for authority to acquire control of the Missouri-Kansas-Texas and of the St. Louis-Southwestern, the Missouri-Kansas-Texas already owning a controlling stock interest in the St. Louis-Southwestern. This application had not been passed on by the Commission, at the end of the year.

A field of general industry which was being affected by railroad purchases was that of the automobile, both passenger cars and freight trucks. Railroads were experimenting in the operation of their own highway motor vehicles as a supplement to their rail service, in order to hold revenues from the transportation of passengers and freight where motor-car competition could take the business away from the steam railroads. The results of such experiments in 1926 would tend to show that the railroads can profitably enter into this business. It was believed that the Baltimore and Ohio's experiment in running fast comfortable motor coaches from hotels in the heart of Manhattan to the Reading-Baltimore and Ohio passenger station on the west shore of the Hudson River had resulted in satisfaction to the patrons of the road and in the development of business that without this service would have gone in part to competing lines.

The principal changes in the personnel of railroad officers were: Frederick D. Underwood, president of the Erie Railroad since 1902, resigned and was succeeded by John J. Bernet. Mr. Underwood began railroad work on the Chicago, Milwaukee and St. Paul as a clerk. He changed from office work to outdoor labor within a short time, and became a brakeman and then a foreman of elevators, a conductor and then a yard master. After he had been made president of the Erie and had brought that road through what appeared to be almost inevitable receivership, had rehabilitated it and made it a first-class

freight trunk line between New York and Chicago, he said that the hardest job he ever had was yard master in the Minneapolis yards of the Chicago, Milwaukee and St. Paul. He was promoted from yard master to assistant division superintendent and then to superintendent, and later was made general superintendent of construction of the Minneapolis and Pacific, now a part of the Minneapolis, St. Paul and Sault Ste. Marie, and was finally made general manager of the Minneapolis, St. Paul and Sault Ste. Marie. After 13 years, in 1899 he became general manager of the Baltimore and Ohio and was later elected vice-president, from which position he went to the Erie in 1901 as president. Mr. Underwood had the backing of the late E. H. Harriman, and with this backing he refused to take the Cincinnati, Hamilton and Dayton and Pere Marquette off the hands of J. P. Morgan & Co. He was president of the Erie in 1907, when Mr. Harriman gave his own check for the payment of Erie bonds rather than let the Erie go into receivership. Frederick D. Underwood is a notable example of the older generation of railroad men who became executives after having started in the lowest ranks of railroad employment.

In December, 1926, Charles N. Whitehead (q.v.), president of the Missouri-Kansas-Texas, died, and Columbus Haile, vice-president in charge of traffic of the Missouri-Kansas-Texas, was elected president. On Dec. 20, 1926, W. R. Scott (q.v.), president of the Texas lines of the Southern Pacific, died.

**LABOR SITUATION.** In January, a bill was introduced into Congress by Chairman Watson of the Senate committee on interstate commerce, embodying a plan for the adjustment of railway labor disputes. This plan had been agreed upon by representatives of the railroad managements and of the railroad labor organizations. It provided for the abolishment of the Railroad Labor Board and provided for the creation of boards of adjustment and a board of mediation to be appointed by the President, and prescribed the methods of submitting railroad labor disputes to arbitration. It also gave the President authority to appoint an emergency board of arbitration should occasion arise. The board consisted of Samuel E. Winslow, Edwin P. Morrow, Carl Williams, G. W. W. Hanger and Hywel Davies. The bill was passed by the senate in May.

In February, the general chairman of the Order of Railway Conductors and the Brotherhood of Railroad Trainmen submitted demands for a wage increase in train and yard service averaging about 20 per cent over existing scales, and ranging from 15 per cent in the case of passenger conductors to more than 27 per cent in the case of passenger trainmen. On October 28 the board of arbitration began hearings on this application, and on December 2 granted an increase of 7½ per cent in wages to trainmen employed on Eastern railroads.

In December, also, wage increases ranging from one to three cents an hour were granted by the Western railroads to shopmen. The increase affected about 40,000 men.

**LEGAL DECISIONS.** The only important decision directly affecting railways during the year was a decision by the United States Supreme Court upholding the authority of the Interstate Commerce Commission under the transportation

*Herbert Photos, Inc.*

THE UNITED STATES RAILWAY MEDIATION BOARD OF 1926

LEFT TO RIGHT: SEATED—E. P. MORROW OF KENTUCKY, COLONEL SAMUEL WINSLOW OF MASSACHUSETTS, G. W. W. HANGER OF WASHINGTON, D. C. , STANDING—HYVEL DAVIES OF CALIFORNIA, AND CARL WILLIAMS OF OKLAHOMA

act to authorize the abandonment of a branch railway line that runs wholly within the boundaries of a State.

**RAILWAYS, ELECTRIC.** The Great Northern Railway, as mentioned in the YEAR BOOK, 1925 (see RAILWAYS, ELECTRIC) completed the construction of a new power supply line and the equipment of 24 miles of main line in the Cascade Mountains. Two electric locomotives were delivered by the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Co., for operation on the newly installed system. They were notable on account of being built with motor-generator equipment, which received energy at 11,000 volts, single-phase, 25 cycles; and through the use of a step-down transformer the current energized a synchronous alternating current motor which in turn drove a direct-current generator supplying 1500-volt direct current to the main traction motors of the locomotive. These engines were of two-unit type and almost 7000 horsepower. They were 94 ft. long, and they weighed 715,000 lb. and had a continuous rating of 88,500 lb. tractive effort at 15.5 miles per hour. The electrical system was arranged for regenerative braking, giving excellent control of heavy trains on descending grades by means of so connecting the motors that they ran as generators, the current thus developed being returned to the overhead line.

The Illinois Central R. R., which had been pushing electrification work on its suburban district in Chicago, began during the year operation of 106 miles of track so equipped, putting in service more than 200 multiple-unit passenger cars supplied by 1500-volt direct current through an overhead catenary conductor system. A contract was made with the Commonwealth Edison Co., of Chicago for furnishing the electric energy required.

The Pennsylvania Railroad was building at its Juniata shops six locomotives for service between New York City and Manhattan Transfer, N. J. The motors and other electrical equipment for these engines were supplied by the Westinghouse Electric & Manufacturing Co. The general arrangement was somewhat similar to the electric engines used for some years by the Pennsylvania in its New York City Service, except that the structure was a single unit with two pairs of driving axles and the truck at each end had only one axle instead of two, as in the older design. The driving wheels were actuated by side rods from a jack shaft, which was driven, through pinions and flexible gears, by two 600-volt, d. c. motors. The wheel arrangement was thus 2-8-2, with two motors driving a jack shaft at each end of the locomotive. The motors were expected to develop a total of 3730 hp. and the engine would weigh 400,000 pounds.

In European countries the electrification of steam roads continued, Switzerland adding a large mileage to its already equipped lines, as mentioned in the 1925 YEAR BOOK. In France, the Paris-Orléans Railway system had completed its electrification as far as Vierson, energy being supplied from the hydro-electric station situated at Eguzon. The Midi Railway was operating 240 miles by electric power at the end of 1926, the P. L. M. system 14 miles and the State Railways 30 miles. New installation was also progressing on the Paris-Brives, Paris-Toulouse and on two cross lines, St. Sulpice-Gannat and Brives-Clermont. See RAILWAYS.

**RAMSAY, FRANKLIN PIERCE.** American educator and clergyman, died September 30, at West New Brighton, New York City. He was born in Pike County, Alabama, in 1856. Before entering the seminary at Columbia he took a course at Dickinson College in North Carolina. He was ordained by the presbytery of Western Texas in September, 1881, and he later held pastorates at Laredo, Tex., Dublin, Va., Baltimore, Md., and Augusta, Ky. After this he became president of the Presbyterian College at Fredericksburg, Va., and later president of Oxford College, Alabama. From the latter he went to Clarksburg, Tenn., as professor of philosophy in the Southwestern Presbyterian University, a university later moved to Memphis. Subsequently he went as professor to the University of Omaha, and then to Kendall College, Tulsa, Okla. Dr. Ramsay held tenaciously to the fundamentalist viewpoint throughout the controversy of recent years in the Presbytery of New York although in his younger years he had suffered no little at the hands of the Fundamentalists in the South for his defense of the late Professor Woodrow, grandfather of the late President Wilson, when there was a concerted effort to bring Professor Woodrow to trial for heresy. Dr. Ramsay's last book was *The Virgin Birth*, a discussion from his own decided viewpoint of an age-old controversial subject.

**RAPID TRANSIT.** NEW YORK SUBWAY SYSTEM. In 1926 the route mileage of rapid transit structures awarded for construction amounted to 5.82, of which 4.32 were in the city system and 1.5 miles in the Brooklyn-Manhattan Transit system. The city board of transportation received proposals for construction work amounting to \$75,773,149, embracing eight route miles containing approximately 21 miles of track, and awarded construction contracts amounting to \$55,563,737, giving daily employment to 10,000 men. The awards made during 1926 were divided as follows: City's new subway system, \$47,736,576; Interborough, \$1,526,604; B. M. T. system, \$5,956,724; and miscellaneous, \$343,833. The board of transportation, in addition to the foregoing, received bids aggregating \$20,209,412 for three sections of proposed new Manhattan-Queens route to connect these boroughs via 53d St. and under the East River. Litigation instituted by the Central Park West and Columbus Avenue Association resulted in restraining the board from awarding the connecting-link contracts. At the end of the year, there were under contracts for the city's new subway system 25 sections of the Washington Heights, Central Park West, Eighth Ave., Sixth Ave., and Church St. routes, amounting to \$118,821,252 and extending from Fulton Street to the northerly end of Manhattan. This is the main trunk of the system, from which branches were to spread out under the Harlem River to the Bronx, under the East River at 53d St., Rutgers St., and Fulton St., to Brooklyn and Queens. At the end of the year, contract drawings for the Fulton St., Manhattan-Cranberry St., Brooklyn, connection were practically ready for advertising, and after settlement of the litigation that was involved in the construction of the 53d St., route under Welfare Island to Long Island City, where the Brooklyn and Queens lines adjoin, the board was prepared to take action to award this contract.

The board of transportation awarded four

contracts for lengthening the platforms of 40 stations in the B. M. T. system in Brooklyn and Manhattan, so as to accommodate 8-car trains, being 539 feet in length, so that the passenger-carrying capacity of each train would be increased by 33½ per cent and the length of all trains in service on the B. M. T. system would be standardized. The board also awarded the contract for the construction of a transfer connection between the subway and the elevated lines at 149th Street and Third Ave., in the Bronx, and for an additional passageway at Canal and Varick Sts., to accommodate the approach of the New York and New Jersey vehicular tunnel.

**PHILADELPHIA SUBWAYS.** During the year, work was in progress on six contracts for the construction of 6½ miles of four-track subway in Philadelphia, extending from City Hall to Fern Rock terminal yard, north of Aulney Ave., and for grading the terminal yard, about 33 acres. This work involved an expenditure of \$57,000,000, and was substantially completed at the end of the year, some 28 months having elapsed from the date of breaking ground. Three contracts, with a total length of 3½ miles, were entirely finished at the end of the year, and the remaining three were completed with the exception of some grading and minor details of construction. Two miles of Broad St., were permanently repaved, and additional paving was under way. The work in the terminal yard involved the construction of the inspection shops and the general repair shop buildings. There were also under construction two of the three sub-station buildings required for operating the subway, and the rails and special track work were being delivered, and track laying was in progress. Contracts had been awarded for 150 steel passenger cars to be delivered between May 1 and October 1, and other equipment was being provided for, so that operation of the subway could be carried on by the end of 1927.

**CHICAGO.** During the year various projects were proposed to solve the rapid-transit problem which, as in other American cities, had become one of pressing importance with many complications, of which the matter of the cost and the apportionment of the cost was not the least. Toward the end of the year, the city council approved a plan recommending the part payment of the cost of subway and elevated railway extensions by special assessment on property benefited. It was not certain whether such a method of providing funds was practicable or legal, but it was recommended by an advisory commission which included representatives of large property interests in the business district, in whom would fall a large share of the assessment. The commission which prepared this report recommended that the board of local improvements should institute local improvement proceedings for the proposed Ashland Ave., extension and the Wells and Polk Sts. extension of the elevated line, and that such part of the cost of these improvements as was not provided by assessments should be paid from the city's reaction funds. It was also proposed that there should be a consolidation of the surface and rapid-transit lines to secure unified service, but this was complicated by the fact that some of the surface lines were in the hands of the receivers, so that such a proceeding would be difficult. The commission recommended the construction of two

subways, one for rapid-transit service by the elevated railway trains, extending under State St., from 13th St., to North Ave., connecting with the elevated lines at each end, and affording four tracks for part of the distance. The other subway, for West Side street cars, would form a double low-level loop connecting the existing Washington St., and Van Buren St., tunnels under the river and running east under Washington St., south on Michigan Ave., and west on Jackson St., then diverging south to the Van Buren St. tunnel. This loop would pass under the rapid-transit subway. These two subways would be constructed, according to the recommendations, with an assessment on the property benefited to cover not less than 55 per cent of the cost. The estimated cost of the north and south line was given as \$23,950,000, and \$12,450,000 for the loop line.

**ST. LOUIS.** In September a plan prepared by Consulting Engineer C. E. Smith was submitted, calling for the construction of a subway system which was to be built in three stages. This plan was quite comprehensive, and involved an estimated outlay for the three stages as follows: \$40,000,000, \$72,000,000, and \$100,000,000.

**LONDON.** On September 13 there was put in service the extension to the Charing Cross, Euston, and Hampstead railway from Charing Cross in a double tunnel under the Thames and past Waterloo to Kennington, where connection was made with the City and South London, and the extension of the latter line from Clapham Common to Morden. During the year the single line between Hounslow Central and Hounslow West was doubled, the additional line and a new island platform at the latter station having been put in service December 11.

**RAYMOND, WILLIAM GALT.** American engineer and educator, dean of the College of Applied Science at the State University, Iowa City, Ia., died June 17, at Iowa City. He was born at Princeton, Ia., Mar. 2, 1859, attended the University of Kansas, and took his C. E. degree at Washington University in 1884. From 1884 to 1890 he was instructor in civil engineering at the University of California, and from 1892 to 1904 was professor of geodesy, road engineering, and topographical drawing, at Rensselaer Polytechnic Institute, Troy, N. Y. From 1904 to 1922 he was professor of civil engineering, becoming the professor of engineering in 1922. In 1905 he became dean of the College of Applied Sciences, State University of Iowa, and in the same year he received the degree of LL.D. from Washington University. In 1919 he received the degree of Doctor of Engineering from the University of Michigan. He was a member of the American Society of Civil Engineers, and from 1913 to 1915 president of the Iowa Engineering Society. Among his many publications are *Plane Surveying*, 1896; *Railroad Field Geometry*, 1910; and the *Railroad Field Manual for Civil Engineers*, first published in 1915.

**RAYON.** The phenomenal growth of rayon production throughout the world and particularly in the United States continued in 1926. The world production was estimated by *The Textile World* (New York) at 210,000,000 pounds and that of the United States alone at 62,575,000 pounds, of which seven concerns were responsible for all but 500,000 pounds, the leading firm having a production of 37,000,000

pounds. For 1927 there was in the United States a capacity for the production of 73,500,000 pounds. This growth was remarkable since in 1920 the United States produced but 9,000,000 pounds and the world 50,000,000 pounds. The industry in the United States in 1926 was on a strictly competitive basis, and, in addition to the domestic consumption, considerable rayon was imported during the year, as well as rayon waste and yarns made from rayon waste. The principal consumers of rayon in 1926 were the hosiery and underwear manufacturers, each group taking approximately 25 per cent of the domestic production. These were followed closely by the manufacturers of cotton goods, while silk manufacturers took a certain amount. The use of rayon in the knitting industry, especially for the manufacture of underwear, had grown with rapidity, as, with the reduction in size of the individual filaments, this material became adaptable for the finer classes of goods as well as for the heavy fabrics such as were employed for sweaters, dresses, and outer wear. A somewhat special process of manufacturing rayon knit goods had been evolved and had proved remarkably successful. During the year there had been a decline in prices, amounting to about 27½ per cent so that in the closing months it was believed that the industry had reached the stage where further price reductions, if any, could only come from improvements in manufacturing or an improved technique.

In the year 1926 the United States imported rayon valued at \$13,898,990, as compared with \$13,118,307 in 1925. The 1926 imports included 14,690,810 pounds of yarn waste and thread valued at \$10,463,466. The exports of rayon in 1926 were valued at \$7,680,704, as compared with a value of \$8,700,543 in 1925. This included 1,251,735 dozen pairs of hosiery valued at \$4,708,921 and other manufactures having a value of \$2,971,783.

In Great Britain a number of firms organized in 1925 were in production in 1926 and prices were maintained for the product during the year. One of the largest companies had established factories in the various consuming countries, while the export trade was being developed, though in the export trade Great Britain was finding competition with the other countries of Europe. In Great Britain the imports of rayon yarn dropped from 11,780,564 pounds in 1925 to 2,300,576 in 1926, due almost entirely to the application of customs duties on July 1, 1925. The imports of manufactures of rayon, however, did not change very much and the duties did not affect this trade. In 1925 the total imports of manufactures of rayon were 3,765,277 pounds and in 1926, 3,758,238 pounds. There was an extraordinary increase in the exports of rayon manufactures in Great Britain, these amounting in 1926 to £5,425,496, as compared with £3,068,782 in 1925. The exports of yarn reached 5,838,870 pounds in 1926, as compared with 7,202,708 pounds in 1925.

In France rayon was being manufactured not only by French firms but by various foreign concerns, and there was considerable keen competition. At the close of the year in France the textile designers were developing fancy designs in which rayon was being used in a great variety of fabrics for the new season. Rayon was being combined, both white and colors, with cottons, linens, crêpes, kashas, or other silks. A number

of newer fabrics were so fine and carefully woven that mixtures of rayon were included among materials of the highest grade.

The industry in Belgium also was prosperous, with exports going to France, Germany, and Italy, while imports increased both from Italy and France. The Belgian industry was beginning to feel competition, both from other nations and within its own boundaries, so that prices had fallen. In Germany the rayon manufacturers met with competition from the Italian producers and the industry was endeavoring to standardize and grade the product. In Holland the rayon industry had established a reputation for the quality of its output and the exports were being taken by various countries. In Italy rayon underwent a severe depreciation in the opening months of the year, but recovery took place, so that there was an increased production and export, though the English duties which came into effect on July 1, 1925, reduced the exports to that country. In Czecho-Slovakia the factories were organized so that the raw material, wood pulp, could be obtained within the country's own borders, and it was said that, while the product was made at slight profit, it was being sold at as low prices as anywhere in the world.

**RECLAMATION.** During 1926 the level of prices of agricultural products in the world markets was not such as to encourage land reclamation on a large scale. Nevertheless, there was great activity in various countries in making provision for future reclamation and also in actual construction of reclamation works.

**IRRIGATION.** In the United States in 1926 there was little activity in actual land reclamation, but there were very important developments in the reclamation policies of the Federal Government. Under an act passed in 1924, the projects already established were surveyed, with a view to writing off construction charges against lands in these projects that had been found to be unproductive and, therefore, unable to pay construction charges. The results of these surveys were reported to Congress and by the act of May 25, 1926, Congress provided definitely for writing off construction charges amounting to \$14,667,965, levied against lands classed as "permanently unproductive," and for the suspension of charges amounting to \$12,788,406 against lands classed as "temporarily unproductive." In the reports of the Bureau of Reclamation the latter amount is classed as "probable loss." The largest loss reported was on the Newlands project in Nevada, where it was recommended that \$4,536,396 be charged off. Since the charges written off and suspended were levied against unproductive land, it is not probable that they could have been collected; writing them off is largely a matter of bookkeeping and the acknowledgment of an existing condition. However, this act clears the way for the adoption of a new policy advocated by the Bureau of Reclamation and adopted by Congress; that is, the requirement that land owners shall enter into contracts assuming joint liability for construction charges, to replace the old contracts under which each was liable for only his proportional share of the cost. Under the new contracts, all of the productive land remaining in each of the projects is jointly liable for the remaining construction charges for that project; the owner of productive land must pay the same average charge per acre for which his land

was previously liable, and, in addition, his land is liable for charges against other land now classed as productive but that may become unproductive from any cause. His previous obligation becomes a minimum liability, with no fixed maximum limit. In return for assuming this added obligation, the land owner is given an extension of time of payment on his unpaid construction charges, still without interest on deferred payments. On the assumption that the land owner would have made his payments under the old contract, the extension of time is equivalent to a loan for a long period of years, without interest. It is probable that the value of such a loan is great enough to offset fully the added liability assumed under the new contracts.

The act of 1924, previously referred to, provided for basing repayments, on each project, on average gross returns per acre from farming on that project. This, in most cases, would have amounted to a great but indefinite lengthening of the period of repayment beyond the 20-year period provided for in the previously existing law. The law of 1926 repealed the crop-payment plan except as to pending contracts, and provided a repayment period of not to exceed 40 years. Many contracts involving the crop-payment plan were pending and will be executed, thus giving extensions of time of 20 to 50 years or more in the periods of repayment. For new projects and those not entering into the crop-payment contracts, there is a maximum repayment period of not to exceed 40 years, with joint liability on each project. The new legislation provided also for the selection of settlers on new projects, and made the construction of these projects conditional upon the owners of private lands in excess of 160 acres agreeing to sell their surplus land at prices satisfactory to the Secretary of the Interior. Congress made appropriations in 1926 for new projects that included about 350,000 acres, and had an estimated cost of about \$80,000,000.

The annual report of the Bureau of Reclamation for the year ended June 30, 1926, gives the following statistics: The total area provided with water was 1,802,970 acres; the area irrigated was 1,320,300 acres; the total area cropped was 1,242,750 acres. Of the total area of crops harvested, disregarding double cropping, nearly one-fourth is in cereals, and one-half is in hay and forage crops, leaving only a little more than one-fourth of the acreage producing vegetables and truck (5 per cent), fruits and nuts (3 per cent), sugar beets (4 per cent), and cotton (15 per cent). The total construction cost to June 30, 1926, is given as \$168,526,901; as previously stated, the construction charges written off were \$14,867,965, slightly more than 8 per cent of the total cost; and the construction charges suspended and classed as probable loss were \$12,788,371, or slightly less than 8 per cent of the total. To June 30, 1926, the total expenditures under the reclamation act had been \$214,126,532 and the total collections have been \$66,48,012; leaving a net investment of \$147,278,520. In December, 1926, the Secretary of the Interior issued a statement containing a tentative programme of expenditures for the 10 ensuing years, in which it was stated that the completion of the projects already provided for would require all the estimated receipts of the reclamation fund during that period, and recom-

mending that there be no provision for new projects for the present. There was almost no activity in the construction of irrigation works by private enterprise in 1926.

**DRAINAGE.** During the year 1926 there was little drainage construction in the United States. Large drainage districts in the Mississippi valley and in Florida that constructed works in recent years were engaged in efforts to bring into use the land already drained, rather than in new construction. Settlement progressed so slowly that many of the districts found it difficult to collect taxes and meet their financial obligations. As a consequence, it was very difficult to finance new drainage projects, and there was a growing demand for Federal relief for existing drainage districts, and Federal financing of new projects.

**OTHER COUNTRIES.** Canada, like the United States, was passing through a period of adjustment after a period of overbuilding, with little construction. The Mexican Government entered upon a reclamation campaign in which it was proposed to add some 600,000 acres to the irrigated area, at an estimated cost of \$20,000,000, or about \$33 per acre. A law promulgated Jan. 9, 1926, created a national irrigation commission to handle this work, and an American engineering company was engaged to make surveys and construct the works decided upon. It was planned to complete most of the work within the ensuing two years. An expenditure of 20,000,000 pesos during 1926 was authorized. The Bolivian Government investigated the possibilities of irrigating the Altiplano, a dry plateau containing about one-fourth of the total area of that country. It appeared that there were artesian supplies sufficient for a large part of this area. The Chilean Government proposed to undertake several irrigation projects in the provinces of Coquimbo and Atacama. An expenditure of 25,000,000 pesos received from the rental of Government lands was authorized. The programme for public works in Argentina for 1926 included the expenditure of about 6,600,000 pesos for irrigation works. The Haitian Government had under consideration the irrigation of about 60,000 acres of land in the Artibonite valley, at a cost of about \$50 per acre.

By a royal decree of Mar. 5, 1926, Spain adopted a new system of stream control and development of its water resources. This provided for the creation of districts to control the use of the water of tributary streams, and for the confederation of the districts within each drainage basin to control the main stream and the tributaries. The purpose was the most economical use of the water resources of Spain for power, agriculture, and navigation. The whole administration of the streams was turned over to federations. Federations could be set up on application of interested parties or on Government initiative, and all local bodies or individuals interested in the use of the stream involved were obliged to participate. The Government aided in financing enterprises by direct contributions and by loans. A decree of the same date provided for the creation of such a federation to control the river Ebro and its tributaries. It was estimated that it was possible to irrigate about 1,500,000 acres in addition to 1,000,000 acres already irrigated in this drainage basin, and to develop 1,729,000 h.p. of electric energy. The national subsidy to this enterprise was to be 300,000,000 pesetas, or about 30 per acre of new land. By a royal

order, 5,500,000 pesetas were set aside for irrigation work in 1926. A concession was granted for the drainage of about 30,000 acres in the province of Seville, at an estimated cost of about \$1,000,000. In Greece, projects for reclamation by both irrigation and drainage were under way. The estimated cost of proposed irrigation works was about \$200,000, and of drainage works about \$50,000. In the Sudan, the Sennar dam was opened in January, 1926, making it possible to irrigate a considerable area of land. In Egypt proper, however, construction of the Gebel Aulia dam was suspended. In South Africa, the situation was much the same as with the Federal reclamation projects in the United States—the Government made large advances for the construction of irrigation works, and the land owners have not been able to meet the payments contracted. Consequently, that country is passing through a period of readjustment. In India, construction was in progress on very large reclamation projects. The Lloyd barrage on the Indus, and the canals for distributing the water from this dam, were planned to carry water to about 6,000,000 acres, and to cost about \$70,000,000 for labor and materials. This project was to be completed in 1937. The Sutlej valley scheme in the Punjab includes 5,500,000 acres, and will cost about \$58,000,000. This was to be completed in 1932.

**RED CROSS, AMERICAN.** An organization chartered by Act of Congress in June, 1900, and incorporated in January, 1905. Its purpose is to supply succor to sufferers from the evils of war, and likewise to furnish similar aid in time of peace to sufferers from disaster or from any widespread pestilence or famine. The society is a member of the League of Red Cross Societies, made up of similar societies in 54 nations. A general board directs its activities and manages its affairs. Details of control, management, and administration are delegated to a central committee, and, in time of war, to a war council.

On June 30, 1926, there were 3531 chapters of the American Red Cross. Home service work for disabled veterans and their families was carried on by 2686 chapters, expending \$1,987,000, while the national organization spent an additional \$1,641,178.18 for this purpose. Home service to ex-service men and their families includes assistance in filing death and disability claims for Federal and State benefits such as compensation, bonus, etc., and social or financial aid while adjustment of claims is pending. Hospital social service was conducted in 83 government hospitals, including those of the Veterans' Bureau, Army, Navy, and National Soldiers' Homes, and in eight contract hospitals. Field directors were maintained at all important Army, Navy, and Marine Corps stations and camps, in accordance with the request of the War and Navy Departments that the Red Cross continue to act as "the medium of communication between the American people and their Army and Navy."

The Red Cross rendered service as a relief agency in 90 disasters of various kinds in the year ending June 30, 1926, of which 62 were domestic and 28 occurred in foreign countries, expending in this work \$3,924,902.68, and assisting more than 300,000 persons. Disaster relief was rendered in Colombia, Holland, Belgium, Bulgaria, Syria, Mexico, and Costa Rica, and, among American possessions, in the Philippines,

Alaska, Porto Rico, and Hawaii. The Nursing Service of the organization had 43,503 nurses enrolled as a reserve and a source of supply for the Army, Navy, Public Health Service, United States Veterans' Bureau, and for duty in emergencies, of whom more than 27,000 are active. In 1926, 57,370 students, 38,152 of them school students, were instructed in home hygiene and care of the sick, and 35,610 certificates were issued to them. At the close of the fiscal year there were 798 public health nurses supported entirely or in part by the Red Cross. They made 1,174,539 home visits, 49,254 school visits, and inspected 1,175,128 school children. The nutrition service reached an average of 15,413 individuals a month with regular nutrition instruction.

The year marked the twelfth anniversary of the establishment of the Life-Saving Service, in which 102,070 men, women, and children were enrolled; during the year 7145 men, 5408 women, and 16,713 juniors passed the tests. Volunteer workers in chapters during the year made 145,824 garments, 1,678,409 surgical dressings, and answered 17,890 calls for motor service. More than 100,000 pages of Braille were completed. The Red Cross first aid instruction car was in continuous operation, visiting 125 cities, where 900 meetings and demonstrations were held, with a total attendance of 94,000. Approximately 20,000 certificates were issued to those taking systematic courses of instruction in first aid. Welfare service was provided by 535 chapters for families in communities where no other agency existed for such service.

On June 30, 1926, there were 5,549,428 school children enrolled in the American Junior Red Cross. At the close of the membership year, August 31, the senior membership was 3,012,055. Revenues during the fiscal year ended June 30, 1926, were \$3,206,743.17, or \$4,175,126.18 less than expenditures, and leaving a balance in the treasury of \$17,236,480.40, as against \$21,411,606.58 in 1925. There having been budgeted for the fiscal year \$3,942,392.69, and \$9,489,193.08 set aside for specified activities, there remained on June 30 unobligated funds totaling \$3,804,894.63.

In virtue of his office, the President of the United States is president of the American Red Cross. Other officers in 1926 were: Vice-presidents, Robert W. de Forest and William H. Taft; chairman of the central committee, John Barton Payne; counselor, William D. Mitchell; treasurer, Garrard B. Winston; secretary, Mabel T. Boardman; vice-chairman in charge of domestic operations, James L. Fieser; vice-chairman in charge of insular and foreign operations, Ernest P. Bicknell. Work is centralized in three administrative divisions, one at the National Headquarters in Washington, one in St. Louis, and one in San Francisco.

**REED COLLEGE.** A co-educational, non-sectarian liberal college of arts and sciences at Portland, Oregon; founded in 1911. The enrollment for the fall term of 1926 was 264, of whom 131 were men and 133 women, distributed as follows: freshmen, 100; sophomores, 66; juniors, 52; seniors, 43; specials, 3. The faculty numbered 28. The productive funds amounted to \$1,597,303.40, and the income for the year to \$75,779.24. The library contained 30,481 books and 3000 government documents. President, Norman Frank Coleman, LL.D.

**REFORMED CHURCHES, THROUGHOUT THE WORLD HOLDING THE PRESBYTERIAN SYSTEM, ALLIANCE OF.** This organization was formed in London, England, in the year 1875, with the one great purpose, to encourage comity, co-operation, and efficiency in the accomplishment of Christian work. In its formation many of the leading Presbyterians of America were active, particularly the Rev. William H. Roberts, D.D., for many years Stated Clerk of the General Assembly of the Presbyterian Church in the U. S. A. The First Council was held in Edinburgh, Scotland, in 1877, and the latest or Twelfth Council in Cardiff, Wales, in 1925. There are 106 churches connected with the Alliance, located on all the six continents. The members and adherents of the Presbyterian and Reformed Churches in the world number about 50,000,000, including those in the Evangelical Church in Germany, which has about 113,000. It was planned to hold the Thirteenth Council either in Canada or the United States. The president in 1926 was the Reverend Charles Merle d'Aubigne, D.D.; the general secretary was the Reverend John R. Fleming, D.D.; and the American secretary was the Reverend Henry B. Master, D.D., whose offices were at 912 Witherspoon Building, Philadelphia, Pa.

**REFORMED EPISCOPAL CHURCH.** A denomination formed in December, 1873, by clergymen and laymen who had withdrawn from the Protestant Episcopal Church. It was the outcome of an intense discussion carried on over ritualistic tendencies. As indicated in its name, the denomination held that it supported the principles of the Anglican Church of the time of the Reformation, and of the Protestant Episcopal Church as organized after the Revolution. Doctrine and polity, otherwise in general accord with those of the Protestant Episcopal Church, were anti-sacerdotal. A General Council of the denomination meets triennially, and sat at Philadelphia in May, 1924. Since the episcopate is regarded as ancient and desirable but not as existing of Divine right, bishops do not constitute a separate house in the General Council. The denomination maintains a theological seminary at Philadelphia, Pa., and issues from that city a periodical, the *Episcopal Recorder*. Statistics for 1926 were: churches, 81; ministers, 89; church members, 17,300; Sunday school enrollment, 14,500. Bishop Robert L. Rudolph of Philadelphia was presiding bishop of the General Council.

**REFUSE DISPOSAL.** See GARBAGE AND REFUSE DISPOSAL.

**REGIONAL PLANNING.** See CITY PLANNING.

**REID, JAMES SMITH.** British Latinist and historian, died April 1, at Cambridge, England. He was born at Sorn, Ayrshire, Scotland, May 3, 1846, and was educated at the City of London School and at Christ's College, Cambridge. From 1869 to 1872 he was a fellow of Christ's College, and from 1870 to 1880 he was classical lecturer at the same college. He was classical lecturer at Pembroke College, Cambridge, for two different periods, 1873-1878 and 1880-1885. He was made Honorary Litt.D. of Dublin and Hon. LL.D. of St. Andrews. He was a fellow of the British Academy and for a time president of the Roman Studies Society. In 1878 he was made a fellow of Gonville and Caius College, Cambridge, becoming tutor there in 1885. In 1889 he was appointed

professor of ancient history in Cambridge University, becoming professor emeritus in 1925. He published many papers for learned societies and in addition to his numerous critical editions of the classics contributed articles on archaeology and textual criticism to encyclopædias. His most important work is his *Municipalities of the Roman Empire* (1913).

**REINDEER.** See ALASKA.

**RELATIVITY, THEORY OF.** The general theory of relativity explains perfectly, and has been completely confirmed by, the observed phenomena of the anomalous motion of the planet Mercury, the bending of rays of light passing close to the sun during a total eclipse, and the shift of spectral lines toward the red in the spectra of the sun and of the companion of Sirius. No other tenable explanation of these phenomena has yet been discovered, nor has success attended efforts to question the observations or to find errors in the theory. The theory of relativity, received at first with reluctance and hostility, has now won fairly general recognition on the merit of its remarkable achievements in harmonizing the whole of physical theory and in disposing of a number of previously existing difficulties; and although, like all theories of physics, it is subject to modification and extension as occasion may demand, it has undoubtedly come to stay.

The general theory of relativity was founded on the principle of the equivalence of inertia and gravitation, together with certain results of the restricted theory. The former depends on a large amount of reliable and convincing experimental evidence, none of which has been questioned, while the latter was likewise based on the cumulative evidence of a great number of experiments, all of which had failed to give evidence of any measurable effect due to the motion of the earth through the luminiferous æther. The most famous of these experiments was that of Michelson and Morley. Present evidence for the general theory is thoroughly consistent and concordant; that for the restricted theory, is, however, somewhat conflicting.

Of the numerous experiments upon which Einstein originally based his principle of relativity, several have recently been repeated. Tomaschek, at altitudes of 65, 1850, and 11,400 feet (the last being on top of the Jungfrau), has again looked for the magnetic field which should be produced by the motion of a charged condenser through the æther, and also for the force tending to turn such a condenser out of the plane of the relative motion of earth and æther, but was unable to find any such effects as great as would correspond to a relative motion of over three kilometers per second; the second of the effects named was also sought for by C. T. Chase at Pasadena, Calif., with an apparatus of better design than that used by Tomaschek, but with the same negative result.

D. C. Miller, however, as a result of repeating the Michelson-Morley experiment at Mount Wilson during 1925 and 1926, finds a definite, positive effect due to some cosmical cause which he interprets to be an æther drift corresponding to a constant relative motion of the earth and æther of 10 kilometers per second. The variations in the direction and magnitude of this indicated relative motion are such as would be produced by a constant motion of the solar system in space, with a velocity of 200 kilometers per sec-

ond or more, toward a point in Draco near the pole of the ecliptic; but this interpretation requires the assumption that, in effect, the earth drags the æther along to the extent of 95 per cent, and that this drag displaces the apparent azimuth of the motion always about  $45^\circ$  to the west of north; a recalculation of the earlier experiments by Michelson and Morley in 1887 and by Morley and Miller in 1904 shows this assumption to be consistent with Miller's present results.

Miller's work shows, in agreement with previous findings, that the orbital motion of the earth has no perceptible effect; however, the preceding assumptions that are necessary if his results are to be interpreted as due to a motion of the solar system do not seem very plausible, especially in view of the phenomena of aberration, the Michelson-Gale experiment of 1925, etc. To ascribe the results to an æther drift involves many other grave difficulties, also; and in the opinion of several capable investigators the effects observed by Miller must be due to some other cause. As a matter of fact, R. J. Kennedy again repeated the Michelson-Morley experiment, at Pasadena and at Mount Wilson, with apparatus of a new and improved type, and obtained a perfectly definite null result. Piccard and Stahel have carried out the experiment in a balloon, at altitudes of 2500 and 4500 meters, with an accuracy believed to be sufficient to show that the æther drift, if any, does not increase with altitude beyond the value found by Miller.

The actual existence of an æther drift would necessitate some kind of a modification of the restricted theory of relativity, and several possible modifications of the kind have been suggested; just what effect would be produced on the general theory is not yet clear.

St. John, at the Mount Wilson Observatory, in a new investigation of 331 iron lines in the solar spectrum, finds a general displacement toward the red; strong lines have a displacement 50 per cent greater than that required by relativity, while weak lines are displaced 30 per cent too little, these systematic deviations being connected with the levels in the solar atmosphere at which the lines are produced—the level determines the line intensity, and radial motions downward at high and upward at low levels superpose a Doppler shift on the relativity shift. Relativity effects, Doppler shifts, and effects due to differential scattering, taken together, explain the observed displacements quite satisfactorily, but no one of these alone is capable of giving a simple and acceptable interpretation. See PHYSICS.

**RELIGIOUS DENOMINATIONS.** See articles on the respective denominations.

**RENSELAER POLYTECHNIC INSTITUTE.** A non-sectarian institution for the technical training of men at Troy, N. Y.; founded in 1824. In 1926 there were 1307 students enrolled for the fall term, distributed as follows: civil engineering, 379; mechanical engineering, 208; electrical engineering, 491; chemical engineering, 128; business administration, 38; pre-medical, 24; physics, 7; chemistry, 6; special students, 7; graduate students, 19. The faculty numbered 106, an increase of 6 over 1925. The productive funds amounted to \$4,049,000, and the income for the year to \$574,000. The gifts for endowment during the year amounted to

\$134,000, and those for buildings to \$82,000. A library building, with an auditorium, to cost about \$320,000, was in course of construction, as well as the new Caldwell dormitory, which was expected to be finished early in 1927. The library contained 17,313 bound volumes and 19,351 pamphlets. President, Palmer C. Ricketts, E.D., LL.D.

**REORGANIZED CHURCH OF JESUS CHRIST.** See LATTER DAY SAINTS, REORGANIZED CHURCH.

**REPARATIONS.** See GERMANY, under *Reparations*.

**RESEARCH COUNCIL, NATIONAL.** A co-operative organization of scientific men of America, interested in pure and applied science, including engineering and industry. It was established in 1916 by the National Academy of Sciences at the request of the President of the United States, for the purpose of coördinating the research facilities of the country for work on war problems involving scientific knowledge. By executive order it was reorganized in 1918 as a permanent body, its essential purpose being to promote scientific research and the application and dissemination of scientific knowledge for the benefit of the national strength and well-being. It maintains a close coöperation with governmental scientific bureaus and their activities, and has the formal recognition and co-operation of 75 major scientific and technical societies through the country, its membership being composed in large part of appointed representatives of these societies.

The activities of the Council are conducted by a series of major divisions, arranged in two groups. One group comprises seven divisions of science and technology, representing physics, mathematics, and astronomy; chemistry and chemical technology; biology and agriculture; the medical sciences; psychology and anthropology; geology and geography; and engineering and industrial research. The other group consists of five divisions of general relations, as follows: foreign relations; government relations; state relations; educational relations; and research information. Among the larger undertakings of the Council during the year 1926 were the maintenance of about 150 fellowships; work on the preparation and publication of international critical tables of numerical data in physics, chemistry, and technology, undertaken at the request of the International Research Council; the establishment, in coöperation with the American Petroleum Institute, of a Central Petroleum Committee which began a series of fundamental investigations in the physics, chemistry, and geology of petroleum; studies in sedimentation; shoreline investigations of the Atlantic Coast; studies on scientific problems of sex; medicolegal problems; studies in the physical causes of deafness and the tactual interpretation of oral speech and vocal control by the deaf; studies in tropical biology; studies in industrial lighting; research in construction of highways; studies in electrical welding and electrical insulation; studies in child development; studies in racial differences.

The financial support of the Council is derived first from a gift of \$5,000,000 from the Carnegie Corporation of New York, and second from other gifts from various sources, mostly made for the specific support of particular undertakings. These include the Rockefeller Founda-

tion, General Education Board, International Education Board, Laura Spelman Rockefeller Memorial, Commonwealth Fund, and various individuals and industrial concerns. The Council maintains two regular series of publications, one called *Bulletins*, of which 55 had been issued up to the end of 1926; and the other called *Reprint and Circular Series*, of which 71 had appeared. It publishes, in addition, miscellaneous publications and its *Annual Report*.

The general administrative officers of the Council in 1926 were: chairman, Gano Dunn; first vice-chairman, A. A. Michelson; second vice-chairman, Charles D. Walcott; third vice-chairman, R. A. Millikan; fourth vice-chairman, John C. Merriam; treasurer, George K. Burgess; permanent secretary, Vernon Kellogg. George E. Hale of the Mount Wilson Observatory, Pasadena, Cal., was honorary chairman. Headquarters of the Council are on B Street, between 21st and 22d Streets, Washington, D. C.

**RESERVE OFFICERS.** RESERVE OFFICERS TRAINING CORPS. See MILITARY PROGRESS, under *United States*.

**RESSLER, EDWIN DE VORE.** American educator, dean of the school of vocational training, Oregon State College, died October 17. He was born Nov. 2, 1869, at Westerville, Ohio. He took his B.A. degree at Otterbein University, Westerville, in 1891, and his M.A. at Ohio State University in 1897. He taught for five years in Ohio, and spent four years as inspector of schools at Westerville. From 1897 to 1901 he was superintendent of schools at Eugene, Ore., and he became assistant professor of education at the University of Oregon in 1901. From 1902 to 1909 he was president of the Oregon Normal School, Monmouth, and in 1909 he was appointed professor and head of the department of education, at Oregon Agricultural College. In 1918 he was made dean of the school of vocational education in Oregon State College, which post he held till his death.

**RÉUNION, rā'u'nyōn'.** An island belonging to France, about 420 miles east of Madagascar. Area, 970 square miles: population, according to the census of 1921, 172,190, of whom 167,947 were Europeans, mainly of French origin. The chief towns with their population in 1921 were: St. Pierre, 27,895; St. Denis, 21,538; St. Paul, 19,456; and St. Louis 14,803. The chief port is Pointe-des-Galets. The principal products are rum, sugar, manioc, coffee, tapioca, vanilla, spices, etc. The production of rum in 1924 was 1,043,963 gallons, the greater part of which was exported. The exports in 1924 amounted to 150,000,000 francs and the imports to 104,000,000 francs. The chief exports were sugar and rum, and the chief imports rice and grain. In 1924, 107 vessels entered and 108 vessels cleared the ports of the island. There are about 80 miles of railways. The budget for 1924 balanced at 22,715,023 francs, and the debt on Jan. 1, 1925, was 566,500 francs. The government of the island is administered by a governor, aided by a privy council and an elected council-general. Réunion is represented in the French parliament by one senator and two deputies.

**REVOLUTION, AMERICAN.** See CELEBRATIONS.

**RHEAD, LOUIS.** American artist and angler, died July 29, at Amityville, N. Y. He was born at Etruria, England, in 1857, and received his education at the South Kensington School, Lon-

don. His father, George Wolliscroft Rhead, was also a well-known artist. With his brother Frederick, Louis Rhead came to the United States in 1883, to become art manager for D. Appleton & Co., and in a short time the brothers achieved fame as book and magazine illustrators. Much of their work appeared under the name "The Brothers Rhead." Louis Rhead exhibited his oil and water color paintings in American and European galleries. He was awarded a gold medal in Boston in 1895 for his artistic posters, and another gold medal at the St. Louis Exposition in 1904. Mr. Rhead wrote much on hand-made lures and flies for fishing. He wrote a book on Robin Hood himself and supplied the illustrations.

**RHODE ISLAND. POPULATION.** According to a State census made in 1925, the population was 679,260, as compared with 604,397 at the United States Fourteenth Census in 1920, and 595,986 at the census of 1915. The estimated population on July 1, 1926, was 693,000. The capital is Providence.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926.

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	45,000	58,000 *	\$1,450,000
	1925	46,000	59,000 *	1,386,000
Corn	1926	9,000	432,000	497,000
	1925	9,000	405,000	486,000
Potatoes	1926	3,000	450,000	810,000
	1925	2,000	280,000	686,000

\* tons.

**MINERAL PRODUCTION.** The State produced in 1924, 171,350 short tons of stone, and 161,080 short tons in 1923; in value, \$742,701 in 1924 and in 1923, \$649,359. Clay products, lime, sand and gravel were also produced in commercial quantities. The total value of the State's mineral products in 1924 was \$1,132,641; in 1923, \$1,022,528.

**FINANCE.** As summarized by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State in the fiscal year ending Nov. 30, 1925, were \$5,939,108. Their rate per capita was \$8.72, as against \$8.82 in 1924 and \$5.71 in 1917. Their total included \$425,643 for education, apportioned among minor civil divisions. Payments amounting to \$493,535 for interest on debt and \$2,993,368 for permanent improvements, added to payments for maintenance and operation of State departments, made the year's total of State payments \$9,426,011. For highways was expended the sum of \$2,641,469, of which \$737,461 was for maintenance and \$1,904,008 for construction.

Revenue receipts of the State were \$8,981,305, or \$13.19 per capita. They exceeded by \$2,548,662 the total payments except for permanent improvements, and were \$444,706 less than the total with these included. Payments in excess of revenue were met from the proceeds of debt obligations. Property and special taxes formed 48.8 per cent of the revenue in 1925, as against 52.7 per cent in 1924, and 62 per cent in 1917. Their per capita rate was \$6.44 in 1925, \$6.40 in 1924 and \$4.70 in 1917. Earnings of the departments and compensation for officials' services furnished 6.5 per cent of the 1925 revenue; business and non-business licen-

ses, 33.9 per cent. License receipts included those from taxes on incorporated companies, on sales of gasoline and on motor vehicles. The net indebtedness of the State on Nov. 30, 1925, was \$10,372,152, or \$15.23 per capita, as against \$15.41 in 1924 and \$10.94 in 1917. The assessed valuation of property subject to State tax was \$1,185,720,116. The State tax levy was \$1,422,864, or \$2.09 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 196. No new construction in 1926 and no abandonment of moment were reported.

**EDUCATION.** The voters of the State, in a popular referendum, authorized bond issues to a total of \$1,200,000 for educational outlays. With the proceeds were to be erected additional buildings at the Rhode Island College of Education and at Rhode Island State College. There were established pensions for teachers, at the expense of the State exclusively. These range from a minimum of \$500 to a maximum of \$700, according to W. E. Ranger, State commissioner of education. A law went into effect making it possible to proceed against habitual truants and pupils habitually misconducting themselves, as wayward minors. Those between the ages of 16 and 18 who frequented poolrooms, drinking places, houses of ill repute or gambling houses were made amenable to prosecution for misdemeanor.

**CHARITIES AND CORRECTIONS.** The State Public Welfare Commission established in 1923 has supervision of the penal and charitable public activities. The following institutions with their population according to the November, 1926, census report, are under its supervision: State Hospital for Mental Diseases, 1742 patients; State Infirmary, 673 patients; State Prison and Providence County Jail, 516 inmates; Reformatory for Women, 136 inmates; Sockanosset School for Boys, 178 inmates; Oaklawn School for Girls, 56 inmates; Exeter School (for feeble-minded), 430 inmates; and Home and School (for dependent and neglected children), 250 inmates. The Children's Bureau supervised 406 children in free homes, and 464 in paid homes. The Mothers' Aid Department aided 325 families and 1093 individuals. The State Probation Department and the Psychological Division also are under the supervision of the State Public Welfare Commission. The latter division was established during the year, while the State Probation Department was reorganized. The Children's Bureau also was established in 1926. At the election in 1926 approval was voted of a bond issue to the amount of \$1,000,000 for general improvements and new buildings at the State institutions.

**LEGISLATION.** The State legislature met in regular annual session in January. It enacted statutes for the control of school children and minors; see *Education*, above. Extensive amendments were also made in the laws on juvenile courts and on the care of delinquent and wayward children. Resolutions to amend the State constitution were passed as follows: To alter the State senate apportionment in favor of the city of Providence; to provide biennial registration, in harmony with the existing system of biennial elections for State offices; to abolish property qualifications for voters in the cities of the State alone, and not in the towns. These resolutions, having had their first passage in

1926, awaited repassage in 1927 and subsequent submission to popular vote in 1928.

**POLITICAL AND OTHER EVENTS.** Governor Aram J. Pothier, running on the Republican ticket, was reelected November 2, for the two-year term beginning January, 1927. He defeated the Democratic candidate, Joseph H. Gainer, by approximately 13,000 votes. All three seats of the State's delegation to the United States House of Representatives for the 70th Congress were gained by Republicans. Other State officers elected in November, to take office in January, 1927, were lieutenant-governor, Norman S. Case, and treasurer, George C. Clark.

Rioting incidental to a textile strike rendered it necessary to employ State troopers at Manville August 31. The State Republican convention held October 13 adopted the proposal to resubmit the alcoholic prohibition issue to the people of the United States. In the city of Providence the construction of a 25 story business building, to be the highest in the city, was begun. This structure was to be known as the Industrial Trust Company Building, and was to reach completion in 1928.

**OFFICERS.** Governor, Aram J. Pothier; Lieutenant-Governor, Nathaniel W. Smith; Secretary of State, Ernest L. Sprague; Treasurer, Richard W. Jennings; Auditor, Philip H. Wilbour; Attorney-General, Charles P. Sisson.

**JUDICIARY.** Supreme Court: Chief Justice, William H. Sweetland; Associate Justices: Walter B. Vincent, Charles F. Stearns, Elmer J. Rathbun, John W. Sweeney.

**RHODESIA**, rō-dé-zhī-ā or -zī-ā. The name given to a stretch of British territory in Central Africa, extending northward from the Transvaal to the borders of the Belgian Congo and Tanganyika Territory; constituting a British protectorate; bounded on the east by Portuguese East Africa, Nyasaland, and the Tanganyika Territory, and on the west by the Belgian Congo, Portuguese West Africa and Bechuanaland. It is divided into Northern Rhodesia and Southern Rhodesia by the Zambesi River; Southern Rhodesia comprises Matabeleland and Mashonaland.

**NORTHERN RHODESIA.** In 1911 this region was formed from the former provinces of Northeast and Northwest Rhodesia. Area, 291,000 square miles; the native population on Mar. 31, 1925, was 1,106,534. The seat of government is Livingstone, on the Zambesi. The chief crops are corn, cotton, wheat, tobacco, fruits, and rubber, and the minerals include gold, copper, zinc, and lead. The total value of all mineral production in 1924 was £3,330,391, of which the production of lead supplied £214,445. Imports in 1924 amounted to £684,183; exports, £455,917. The chief exports are live animals, lead, copper, corn, flour, hides and skins, and tobacco. The administration consists of a governor and executive council and a legislative council, partly official and partly elected, the official members having the majority. Governor after Apr. 1, 1924, when the British South Africa Company was relieved of the administration, Sir Herbert J. Stanley.

**SOUTHERN RHODESIA.** The area of this section of Rhodesia is estimated at 149,000 square miles and the population, according to the census of 1921, 33,620 Europeans and 770,000 natives. Capital, Salisbury. At the end of 1924 the schools numbered 91, of which 8 were secondary, with an enrollment of 6596 Europeans; and 1216 schools for natives with a total enrollment of

77,610 pupils. The agricultural resources are rich, and stock raising is important. The crops include grain, tobacco, wheat, and peanuts, and there is an expanding production of many varieties of fruit. The total output of minerals in 1924 was valued at £4,478,499 as compared with £4,300,052 for 1923. Gold was the leading mineral as usual, the production being 627,729 ounces, valued at £2,939,562. Other minerals produced were silver, chrome, asbestos, mica, arsenic, wolframite, antimony, scheelite, and diamonds. The imports in 1924 were valued at £4,054,502 and the exports, £5,564,716. The chief imports are foodstuffs, textiles and machinery; the chief exports, minerals, tobacco, and grain. The revenue for 1924 was £1,521,881 and the expenditure, £1,594,137. Executive power is vested in a governor aided by an executive council; legislative power is an elected legislative assembly. Governor and Commander-in-Chief at the beginning of the year, Lieut.-Col. Sir John R. Chancellor; Prime Minister and Secretary for Native Affairs, Sir C. P. J. Coghlan.

The railways serving this colony aggregate 2462 miles, of which 1252 are within Southern Rhodesia. All the lines are controlled and operated by the British South Africa Co., except one stretch operated by the South African Government Railways and part of the main line north to Bukama, located in Belgian territory. Their coast connections are mainly eastward to the Beira Railway and the port of Beira in Portuguese East Africa, but there is also connection with the South African Railway to other ports at greater distances. In October the *Railway Age* reported that a railway commission composed of three members and a chairman—one member from Northern Rhodesia, one from the Bechuanaland Protectorate, and one from Southern Rhodesia, the chairman to be appointed by the three governments jointly—would regulate the railways under a new agreement made between the Colonial Office, the British South Africa Company, and the Rhodesian government, in order that the roads may be administered as a single system. Each of the Governments concerned, under the agreement, was to take steps to pass legislation providing that all railway charges shall be subject to the approval of the commission, and also that such charges shall be so fixed that the annual net revenue of the railway, together with the other sources of revenue of the railway company, will, in the view of the commission, yield the amount to provide for interest on present debentures, loans, and such fixed charges as may be agreed upon; for such allowances as shall be necessary adequately to remunerate any additional capital required; for a sum of £150,000 to be available for distribution to shareholders and to be known as a dividend provision; and for a sum of £350,000 to be put in reserve until it has accumulated to the amount of £1,000,000, when the sum to be budgeted shall be reduced to £150,000 annually until the accumulation has reached £1,500,000, when the provision with regard to this item shall cease. Under the agreement it was determined that in any year when the income shall exceed the amount required, 10 per cent of the excess shall be available for dividends. In any year in which the railway income shall be less than the amount required, the deficiency shall be apportioned between the sum available for distribution to shareholders and the sum to be put in

reserve, in the proportion which the dividend provision bears to the reserve provision for that year. The year commencing Oct. 1, 1927, shall be the first, it was decided, in which the new railway commission shall become operative. The governments have agreed upon a policy to bring into force a general code of railway legislation providing for public safety, methods of operation, railway facilities and accommodations.

**RICE.** Production estimates received by the International Institute of Agriculture, Rome, from eight important rice-growing countries, not including India and China (which produce the bulk of the world's crop), showed the yield of 1926 for these countries to be 8.6 per cent above the average yield and 6.3 per cent above the yield of 1925. These estimates indicated a yield of rough rice of 527,054,500 bushels for Japan, 275,047,600 for Java and Madura, 138,188,000 for Korea and 32,040,000 for Italy. China is roughly estimated to produce between one-fourth and one-third of the world crop. India, considered as ranking next to China in rice production, reported a crop of 2,327,061,700 bushels for 1925. Spain, ranking next to Italy in rice production in Europe, has an annual crop of nearly 15,000,000 bushels. In South America, Argentina, for the years 1920 to 1924 inclusive, produced an average yield of 38,652,700 bushels and Brazil 465,900. Estimates published by the Department of Agriculture placed the production of the United States in 1926 at 41,006,000 bushels, the area at 1,018,000 acres and the average yield at 40.3 bushels per acre as compared with 33,309,000 bushels, 887,000 acres and 37.5 bushels per acre in 1925.

The average farm price Dec. 1, 1926, was only \$1.097 per bushel, while the corresponding price the year before was \$1.538. On this basis, the total value of the 1926 and 1925 crops was \$44,988,000 and \$51,232,000, respectively. The production by States in 1926 was as follows: Louisiana 16,088,000 bushels; Arkansas, 10,017,000; California, 7,986,000; Texas, 6,142,000; Missouri, 610,000; South Carolina, 85,000; Georgia, 60,000; and Mississippi, 18,000. Missouri produced 50,000 bushels in 1924 and 300,000 in 1925, while the acreage increased from 1000 acres in 1924 to 10,000 acres in 1926. In the year ended June 30, 1926, according to preliminary reports, the United States exported 27,588,000 pounds of cleaned rice and 20,587,000 pounds of rice flour, rice meal and broken rice, as against 74,602,000 pounds and 37,435,000 pounds, respectively, for the preceding fiscal year. The exports of rice and rice products from the United States have shown a marked decline during the past few years. For the two years ended June 30, 1925, the average annual exports to foreign countries were only 169,892,000 pounds, as compared with 190,995,000 for the two years ended June 30, 1923. Porto Rico and Hawaii are the most important single purchasers of rice in the United States, but their purchases are not included in the export figures given above.

During 1925 and 1926, the United Kingdom, Argentina, Chile, Honduras and Cuba were among the best foreign buyers of rice in the United States. During the year ended June 30, 1926, the imports of cleaned rice amounted to 92,029,000 pounds, of uncleaned rice to 30,749,000, and of rice meal and broken rice to 6,588,000. Most of the cleaned rice was imported from China and the uncleaned rice from Japan. Dur-

ing the year rice-grading schools were conducted in the principal rice centres of Arkansas and Louisiana. Bert Edwards, of Lewiston, Ill., was reported to have grown 135 acres of rice yielding 65 bushels per acre, and this was considered the first time rice had been grown commercially so far north.

**RICE INSTITUTE.** An institution of higher education at Houston, Texas; opened in 1912. The enrollment for the autumn of 1926 was 1296 and the faculty numbered 80. The plant, equipment, and productive funds of the institution were estimated at \$14,000,000, and the income from endowment for the fiscal year 1925-26 was in excess of \$600,000. The library contained approximately 50,000 volumes. President, Edgar Odell Lovett, Ph.D., LL.D.

**RICH, JOHN T.** Former Governor of Michigan, died March 28. He was born at Conneautville, Pa., Apr. 23, 1841. In 1848 his family removed to Michigan, and he received his education in public schools. He was a farmer from boyhood. In 1873 he was elected a member of the Michigan House of Representatives, holding his seat till 1880. In the last four years of this period he was speaker of the house. He was a member of the State senate in 1880-81, and a member of the 47th U. S. Congress, 1881-1883. From 1887 to 1891 he was commissioner of railroads for Michigan, and from 1893 to 1896 he was Governor. From 1898 to 1906 he was collector of customs for the port of Detroit, and from 1909 to 1913 held the same office for Port Huron, Mich.

**RICHEPIN, JEAN.** French author and Academician, died in Paris, December 12. He was born at Medea, Algeria, in 1849, while his father was serving there with the French Army. He was educated at the Lycée Napoléon, Paris, from which institution he was dismissed on account of a youthful escapade. Thereafter he led a spectacular life, which soon turned into literary channels. His first published verses, *La Chanson des Gueux*, so scandalized the world of his time that he was sentenced to four months in prison for their perpetration. At the same time, the success of his work was so instant and complete that he was seen as a writer to be reckoned with, and on his exit from prison he faced the future as one determined to say and publish what he willed. For twenty years from this time he wrote voluminously, achieving his greatest successes in poetry and the drama. Many of his plays were first produced by Sarah Bernhardt. He was a truculent poet, full of new ideas ("blasphemies" they were called by some), and a firm upholder of the romantic tradition. Throughout his early years, after his dismissal from school, he roamed southern Europe, earning a precarious living as teacher of languages, sailor, longshoreman or even porter. Returning to Paris, he settled in the Quartier Latin, where he took as his associates Raoul Ponchon and Paul Bourget, who were then beginning to attract attention as literary lions. The height of his fame was reached in 1897, with his *Le Chemineau*, which was immediately put into the repertory of the State Theatre. There is more than justification for the belief that in this play Richepin has put a great deal of autobiography, and it is so compelling a piece of work that, under one title or another, it has appeared in most European countries, and as *The Harvester* was put on throughout the United States. He

was a member of the French Academy, and an officer of the Legion of Honor. His death was a direct result of exposure at an advanced age while he was watching the filming of one of his plays.

**RICKETS.** Infantile rickets usually begins during the first four months of life, and for some years the idea of the possibility of preventing it by prenatal treatment has been entertained; but the earliest experiments in this direction, in which mothers were placed on cod-liver oil and antirachitic diet, gave negative results. A group of Cincinnati physicians, Greenebaum, Selkirk, Otis, and Mitchell, reported their experience, in the *Journal of the American Medical Association* for Dec. 11, 1926. The experiment individuals were 25 pregnant mothers who had previously given birth to rachitic infants, and the actual experimental period was the last three months of pregnancy, although the women had been under observation before this interval. The food, which was supplied free of cost, consisted of vegetables, cereals, fruit, eggs, and milk, and was intended chiefly to supplement the ordinary house diet which the mothers chose at pleasure. The calorific requirement was placed at 2500 daily, with the equivalent of a certain amount of lime, phosphorus, and iron. The unfortified diet of the women before the experiment fell short of both calory and mineral requirement. The result of the test was that even under ideal conditions rickets could not be wholly prevented but, judging from the röntgenograms of the bones of the infants, there was a notable decrease in the ordinary expectation of the disease. See FOOD AND NUTRITION.

**RIDGEWAY, SIR WILLIAM.** British archaeologist, died August 12. He was born in Ireland on Aug. 6, 1853, and was educated at Portarlinton School and Trinity College, Dublin. He then gained the degrees of M.A. and Sc.D., at Cambridge, and in 1880 became a fellow of Caius College. From 1883 to 1894 he was professor of Greek at Queen's College, Cork, Ireland. In 1892 he was appointed professor of archaeology in the University of Cambridge, which chair he held continuously until his death. In 1907 he was made Brereton Reader in Classics at Cambridge. He was president of the Royal Anthropological Institute of Great Britain and Ireland from 1908 to 1910. From 1900 to 1904 he was a member of the council of Cambridge Senate, and he was president of the Classical Association of England and Wales in 1914. He was a fellow of the Society of British Antiquaries, and a fellow of the Zoölogical Society. He was knighted in 1919 for his services to science. He wrote much, including *The Oldest Irish Epic*, 1907, and *The Origin of Tragedy*, 1910.

**ROADS AND PAVEMENTS.** Rural roads in the United States increased in mileage between 1904 and 1925 from 2,151,379 to 3,001,825 miles, according to figures compiled by *Engineering News-Record* (Jan. 3, 1927) from reports and estimates submitted by the several states to the United States Bureau of Public Roads. For the same period the number of miles surfaced increased from 153,350 to 521,915. The increase in total mileage was nearly 40 per cent, and in total mileage surfaced nearly 50 per cent, but the percentages of miles surfaced to total mileage was 7.1 in 1904 against 17.4 in 1925. It should be noted that "surfaced" means any improvement of the original dirt road by the addition of a

higher grade of material, from mere gravel to the latest improved types of paving material on a concrete base.

**FEDERAL-AID ROADS.** Figures like the above for the full year 1926 are not available, but the United States Bureau of Public Roads reports that on June 30, 1926, there had been completed in the Federal-aid system 55,903 miles of roads, while at that time construction was in progress on 10,962 miles and approval had been given to 2470 additional. The three items total 69,335 miles, out of a total of 182,135 miles selected a few years ago to comprise the Federal-aid highway system designed to link the country together. The official report points out that individual states have improved or initiated improvements to such an extent that nearly three-fourths of the mileage of the system has been or is being improved. The word "improved" as here used means even less than "surfaced" where used above. Of the 56,000 miles of completed Federal-aid roads, some 10,000 miles are as yet unsurfaced; that is, merely graded and drained. (For details by states see the annual report of the U. S. Bureau of Public Roads.) One transcontinental Federal-aid highway (Washington, D. C., through St. Louis, Texarkana and El Paso to San Diego) is 97 per cent "improved," with 2907 of its 3133 miles surfaced and 131 miles graded and drained, leaving only 95 miles without improvement. Ten years ago, when the Federal-aid plan was adopted, only five states had each a single improved trans-state highway (Massachusetts, Connecticut, New York, New Jersey, Maryland). To-day 25 states each have such highway in at least one direction, and 16 of these have them in two directions.

**SNOW REMOVAL** was being rapidly extended. It was estimated that in the 36 "snow states" 93,000 miles of highways would be kept clear of snow in the winter of 1926-27 at a cost of \$4,000,000, and by the use of 3500 snow plows and 5500 tractors.

**CITY PAVEMENTS.** Neither the U. S. Bureau of Public Roads nor the various state highway boards have jurisdiction over city streets, and there exist no central agencies for collecting city pavement statistics. Many of the improved rural highways have as heavy traffic as most city streets and are provided with at least as serviceable and costly pavement.

**FINANCING.** Federal-aid contributions to highway improvements, which now total about \$500,000,000, have been provided out of general income. A large part of the more than equal sum for Federal-aid roads contributed by the states has come from bond issues, as has also the cost of the independent highway work done by the States. The Bureau of Public Roads, in its report for 1925-26, gives a table showing for each state what amount is required to match its part of the yearly \$75,000,000 total of Federal-aid money, and also the gross revenue of each state from motor-vehicle license fees and gasoline taxes for the calendar year 1925. After deductions for states not on a 50-50 basis because of public lands and non-taxable Indian lands, the state funds required to match Federal-aid total \$67,082,000, while the motor and gasoline taxes total \$405,468,000. Massachusetts, New York, New Jersey, and Illinois are the only four states that do not tax gasoline. Twenty-four states had issued no highway bonds since Federal-aid was started. The other 24 had incurred

\$604,411,000 indebtedness in that period, 13 considerably in excess of their contributions to obtain Federal aid. The cost of city pavements is met in large part by assessments on the real estate benefited, in part by taxation and, in some cases, largely by bond issues, the latter often being made to finance the improvements at the outset, even where assessment benefits are levied. See AGRICULTURE, U. S. DEPARTMENT OF.

A notable court decision bearing on the legality of assessing the entire cost of street paving on abutting property, on a straight pro rata front-door basis, was rendered by the Court of Appeals for the District of Columbia in December, 1926 (William G. Johnson et al. vs. Commissioners of the District of Columbia; printed in full in *United States Daily*, Dec. 15 and 16, 1926). The general effect of the decision is to restrict to narrow limits the use of the unqualified front-foot assessment basis, leaving it applicable only where lot depths and values per front foot are substantially equal, and holding further that, in a case like the one at bar, where the street repaved was a main thoroughfare, the cost could not be legally assessed as a local benefit.

**ROANOKE ISLAND CELEBRATION.** See CELEBRATIONS.

**ROCHESTER, UNIVERSITY OF.** A co-educational, nonsectarian institution of higher education at Rochester, N. Y.; founded in 1850. It consists of three schools: the College of Arts and Sciences, composed of a college for men and a college for women; the Eastman School of Music; and the School of Medicine and Dentistry. A school of nursing is maintained in conjunction with the Strong Memorial Hospital, the property of the University. The enrollment for the fall session of 1926, exclusive of extension division and special music students, totaled 1363, distributed as follows: arts and sciences, 897, of whom 468 were men and 429 women; bachelor of music course, 275; certificate of music course, 58; home economics, 42; medicine and dentistry, 52; nursing, 39. For the summer session 678 students were enrolled. There were 954 in the extension division. The faculty had 288 members, as follows: college of arts and sciences, 103, thirty of whom were new appointments; school of music, 83; school of medicine and dentistry, 102, fifty-seven of whom were on full time. The productive funds as of June 30, 1926, were \$25,708,000, and the total resources, including land, buildings, equipment, and endowment, were approximately \$41,380,000. The main libraries contained over 125,000 volumes, the Eastman library over 14,000, and school of medicine library over 30,000. During the year a third unit of the Eastman School of Music Dormitory was erected, providing accommodation for 87 additional students. An addition to the Memorial Art Gallery was completed which more than doubled the capacity of the original building and provided greater exhibition facilities, library quarters, classrooms, offices, and a little theatre. A twelve-story building was under construction to provide additional practice rooms for the School of Music. President, Rush Rhees, D.D., LL.D.

**ROCKEFELLER FOUNDATION.** An institution chartered in 1913 "to promote the well-being of mankind throughout the world." Its work is carried on through its four departmental agencies: the International Health Board; the

China Medical Board; the Division of Medical Education; and the Division of Studies.

The International Health Board during the year 1926 took part in yellow fever, hookworm, and general health surveys, in campaigns for the control of these diseases, in field studies in them, in county and district health work, and in the development of public health laboratory service and other divisions of public health departments. It contributed to schools of hygiene and public health and provided fellowships for training in public health for over 230 men and women of thirty-one different countries. Co-operating with the Health Section of the League of Nations, it contributed funds toward the support of international interchanges of public health personnel and the improvement of services of epidemiological and public health intelligence. Assistance was given in an outbreak of yellow fever in Brazil, and a commission was maintained in West Africa for investigating its prevalence. Yellow fever surveys were made in Mexico, Salvador, Guatemala, and Honduras. The Board contributed to the development of central administration bureaus of eight states where malaria is a problem, and aided the budgets of twenty-six county health units which stress malaria control as a major activity. Coöperation in this field was also given in Porto Rico, Argentina, Brazil, Italy, Spain, Palestine, and the Philippine Islands. The governments of fifteen countries were assisted in programmes for the control of hookworm disease. The services of the director of the Board's work in Siam and the Straits Settlements were lent to the government of Sarawak, Borneo, for a hookworm survey of that protectorate.

Twenty-four states of the United States were aided in the development of local health service, and on Dec. 31, 1926, there were 331 full-time county health units in operation, toward the budgets of 116 of which the Board contributed. Assistance was given toward the establishment of 19 county health units in Porto Rico (its first units), Quebec, and Brazil. In France coöperation was given in public health work in the departments of Hérault, Seine-et-Marne, and Saône-et-Loire; in the district of Hartberg in Austria two health centres were established; a preliminary survey was carried out in the district of Gödöllő, Hungary; coöperative public health demonstrations were conducted in three districts of Poland; and aid was given to public health laboratory service in the States of Alabama, Maine, Missouri, Oregon, South Carolina, Tennessee, Texas, Utah, and Virginia, and in Costa Rica, Nicaragua, Guatemala, Colombia, and China. The States of Alabama, Kansas, Kentucky, Louisiana, Mississippi, Rhode Island, South Carolina, South Dakota, Tennessee, Utah, and Virginia were assisted in expanding their epidemiological services. Coöperation in the development of bureaus of vital statistics was given in Alabama, Arkansas, Iowa, Mississippi, Montana, Oklahoma, and Tennessee, and in Denmark. The government of Venezuela was assisted in organizing a division of sanitary engineering in the National Department of Health; and Alabama, Idaho, Iowa, Maine, Oregon, and Tennessee, and Honduras and Nicaragua were aided in improving their sanitary engineering services. Aid to public health nursing service was continued in Brazil, where a division of nursing education and a division of public health nursing

were being developed in the National Department of Health, and in France, where a Central Bureau of Nurses was being established in the Ministry of Labor, Hygiene, and Social Welfare. Aid to bureaus for the study and reform of public health administration was continued in Czechoslovakia, France, Hungary, and Poland. The following schools of hygiene received aid: the Harvard School of Public Health; the School of Hygiene and Public Health of the University of Toronto; State Institute of Public Health, Prague, Czechoslovakia; School of Hygiene of the State Institute of Hygiene, Warsaw, Poland; London School of Hygiene and Tropical Medicine; Institute of Hygiene, São Paulo, Brazil; Institute of Hygiene, Budapest, Hungary; School of Public Health, Zagreb, Jugoslavia; Institute of Public Health, Oslo, Norway; State Serum Institute, Copenhagen, Denmark; and the Central Epidemiological Institute, Belgrade, Jugoslavia.

The programme of the China Medical Board included the maintenance of the Peking Union Medical College, aid to medical and premedical education in certain other universities and colleges of China, and the provision of fellowships for advancing the training of teachers of medicine, the fundamental sciences, and nursing. At the Peking Union Medical College, undergraduate and graduate training in medicine are provided and a school of nursing is maintained. During the year 1925-26 the medical school had an enrollment of 64 undergraduate students and 82 graduate students, and the nurses' training school an enrollment of 23 undergraduate and 12 graduate students. The teaching staff of the medical school numbered 82, of whom 43 were Chinese. Throughout the year 1926 the medical school assisted the Metropolitan Police Department of Peking in maintaining a public health demonstration centre in the city. The Board made a special contribution toward field studies in kala-azar conducted by the Department of Medicine. Aid to medical education was given in Shantung Christian University and Hsiangya Medical College, and contributions toward the development of the premedical sciences were given to St. John's University, Shantung Christian University, Southeastern University, University of Nanking, Soochow University, Nankai University, Gingling College, Canton Christian College, and Shanghai College. An appropriation was made toward the expenses of a summer institute for science teachers held at Tsinghua College, Peking. Funds were contributed to 17 mission hospitals and to the China Medical Association.

The function of the Division of Medical Education is the study of present-day needs in medical education and, where conditions warrant, co-operation with medical schools in the development of programmes for improving their facilities. During 1926 representatives of the Division visited 21 countries, namely, Austria, Bolivia, Ceylon, China, England, France, Germany, Haiti, Hungary, India, Italy, Japan, Paraguay, Peru, the Philippine Islands, Rumania, Scotland, Siam, the Straits Settlements, Uruguay, and Jugoslavia, for initial study of the status of medical education or in connection with programmes either under consideration or already in force. Assistance in the form of contributions was given to the following 14 institutions: the medical schools of the American University of Beirut, the University of Brussels, the University of

Cambridge, Columbia University (in conjunction with the General Education Board), Chulalongkorn University (Siam), University of Edinburgh, Iowa State University (in conjunction with the General Education Board), the University of Montreal, the University of Oxford, and the University of Strasbourg; the Faculty of Medicine of São Paulo, Brazil; the Institute of Psychiatry of Munich; St. Thomas's Hospital, London; and the New York Academy of Medicine. Grants were also made to a special commission of the Association of American Medical Colleges toward the expenses of a study of the medical curriculum in America, and to the American Medical Association to meet one-half the deficit involved in publishing and distributing the Spanish edition of the *Journal of the American Medical Association*.

A programme of emergency aid, consisting of the provision of scientific literature, laboratory supplies, and resident fellowships, carried out by the Division since 1920 in countries of Europe in which, on account of low exchange and other adverse post-war economic conditions, medical teaching and research had been severely handicapped, was gradually being curtailed. Aid to medical education, in the form of small grants made each year for a series of years to important medical school departments, to be used for apparatus, books, fellowship stipends, expenses of research, or in any other way that may increase the efficiency of the departments for training graduate students as teachers or investigators in medical sciences, was given in certain countries in which, because of economic conditions, the fundamental programme of capital for constructive aid could not be applied. Such aid was given in 1926 to the department of parasitology of the University of Paris and to eleven medical institutes of Italy. The Division grants fellowships to young medical scientists for study in their own or in foreign countries in preparation for teaching positions guaranteed to them in their own countries and to which they pledge themselves to return at the termination of their studies.

To further the interchange of medical students between Great Britain and the United States, the Division coöperates with the British Medical Research Council, which selects promising British medical scientists for work in the United States. It also contributes, in conjunction with the General Education Board, toward the expenses of the Medical Fellowship Board of the National Research Council in Washington, D. C. Study visits under the supervision of the Division in connection with undertakings in which it is especially interested were arranged for representatives from the University of Edinburgh, the University of Lyons, and the faculty of medicine of São Paulo. During the year the Division issued vols. iv and v of its series *Methods and Problems of Medical Education*. Volume iv is devoted to a description of the system of recording, filing, and storing clinical histories, employed at the Presbyterian Hospital, New York; volume v contains twenty-two articles describing teaching and research departments in twelve medical centres of North America, China, France, and the Netherlands.

During 1926 the efforts of the Division of Studies, created in 1924 to investigate work that the Foundation might wish to undertake from time to time and to administer work not within

the province of the existing Foundation boards, were centred mainly on the development of its programme in the biological sciences and on nursing education. It also continued coöperation in hospital and dispensary studies. Funds were granted during the year to the Institute of Biological Research of the Johns Hopkins University for studies of the possible extension of the human life span; to the Institute of Psychology of Yale University for psychological and biological research on anthropoids; to the State University of Iowa for studies in brain physiology; to the Marine Biological Station maintained by Stanford University at Pacific Grove, Calif., for the erection of a new laboratory; to the National Committee for Mental Hygiene in the United States, and to a committee of the same name in Canada, for studies and demonstrations; to the International Biological Abstracting Service for publication expenses; and to the National Research Council for the support of fellowships in the sciences of human biology and in physics, chemistry, and mathematics. Sums were also made available for fellowships in human biology administered directly by the Foundation.

Early in the year a survey of the status of the biological sciences in the countries of the Pacific, made by Professor Clark Wissler of Yale University, Professor E. G. Conklin of Princeton University, and Dr. Richard M. Pearce, the Director of the Division, was completed. Funds were provided to enable scientists from Australia and Japan, distinguished in the fields of biology or anthropology, to visit the United States for study of laboratory administration and discussion of problems of human biology with American investigators.

The year's programme in nursing education included aid to nurse training courses at the following institutions in the United States: Yale University, Vanderbilt University, the George Peabody College for Teachers, and the D. Ogden Mills Training School for Nurses at Saranac Lake, N. Y.; to important government or university schools of nursing in Paris and Lyons, France, in Cracow, Poland, and in Belgrade and Zagreb, Jugoslavia; and to the Nurse Training School of Siriraj Hospital, Siam. Members of the Division made surveys of nurse training schools in the United States and in Europe; a study of maternal care in England was completed; fellowships were provided for the further training of administrators and teachers in schools of nursing, and funds were made available to enable leaders in nursing to visit important training centres in Europe and the United States.

The activities of the Foundation and its departments are described in the annual reports which include: *The President's Review*, a brief illustrated résumé of the year's work, published in English and French; the *Report of the International Health Board*, published in English and Spanish; the *Report of the China Medical Board*; and the complete *Annual Report of the Foundation*. Its principal funds in 1926 amounted to \$165,204,624, of which both the income and the principal are available for appropriations. Its resources and policies are controlled by a self-perpetuating board of unsalaried trustees. The executive officers in 1926 were: John D. Rockefeller, Jr. chairman of the board of trustees; George E. Vincent, president; Frederick F. Russell, M.D., general director, International Health Board; Roger S. Greene, general director, China

Medical Board; Richard M. Pearce, M.D., director, Division of Medical Education; Edwin R. Embree, director, Division of Studies; Norma S. Thompson, secretary; L. D. Meyers, treasurer. Offices are maintained at 61 Broadway, New York.

**ROCKS.** See GEOLOGY.

**RODGERS, JOHN.** Commander, United States Navy, died at Philadelphia, Pa., August 27, as the result of an airplane accident. He was born at Washington, D. C., Jan. 15, 1881, and had a preparatory education at Lawrenceville, N. J. School, 1896-97. He was graduated from the United States Naval Academy in 1903, becoming an ensign in 1905. He was the second naval aviator to receive a license (1911), and in the World War he was employed in the submarine service and in connection with the North Sea mine barrage. He had also served in the Spanish-American War. In 1920 he became commander and from 1922 to 1925 he was commandant of the naval air station at Pearl Harbor, Hawaii. In 1925 he was appointed assistant chief of the Bureau of Aeronautics, and in the same year he was in charge of the Navy seaplane in the attempted non-stop flight from San Francisco to Hawaii. He was killed when his airplane fell into the Delaware River, on a flight from Washington to Philadelphia.

**ROEBLING, WASHINGTON AUGUSTUS.** American engineer, died at Trenton, N. J., July 21. He was born at Saxonburg, Pa., May 26, 1837, the son of a civil engineer, John A. Roebling, a native of Prussia, who had gained his degree at the Royal Polytechnic School, Berlin. Colonel Roebling, having been graduated from Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, acted as assistant to his father. When the Civil War broke out the younger Roebling was engaged in his first independent work, the Allegheny, Pa., suspension bridge. He enlisted on the day that Fort Sumter was bombarded, joining Co. A of Trenton for three months and later seeing service for a year with the 6th New York Artillery. After this he was appointed to the staff and made daily balloon ascents; it was through one of these trips that he was able to be first with the news that General Lee was moving on Gettysburg. In January, 1865, he resigned his commission and went to Cincinnati to assist his father in the completion of the Cincinnati-Covington bridge. When his father died before completing his survey for the construction of the first Brooklyn suspension bridge, Colonel Roebling undertook to carry the work through. At great personal cost in the matter of health, he supervised every stage of the preparatory work until ordered by his physician, in 1872, to cease his visits to the bridge. Even when away from the actual site of operations, he drew up such minutely accurate specifications and instructions as to show his entire grasp of all the problems involved. When, after surmounting many serious obstacles, he successfully carried out the task in 1883, he had the credit of constructing what was then the longest suspension bridge in the world. He was the first president of John A. Roebling's Sons Co., which was incorporated in 1876. After a time his other activities caused him to relinquish the post but he was recalled as president, a few years prior to his own demise, by the death of his nephew, Karl G. Roebling. He also was an authority on mineralogy.

**ROGERS, HENRY WADE.** American jurist, United States circuit court judge, died August 16, at Pennington, N. J. He was born at Holland Patent, N. Y., Oct. 10, 1853, and was graduated from the University of Michigan in 1874. He was admitted to the bar in 1877 and passed several years in the service of the University of Michigan, as Tappan Professor of Law (1883-1890), dean of the Law School (1885-1890), and lecturer on domestic relations and criminal law, from 1890 to 1891. From 1891 until 1900 he was president of Northwestern University, Evanston, Ill. In 1900-1901 he was called to Yale University as a lecturer in the law school, becoming professor in the latter year. He became dean of the Yale Law School in 1903, and in 1913 he was appointed United States Circuit Judge of the second judicial circuit, with chambers in New York City. While thus serving on the bench, he still maintained his connection with Yale, occupying the chair of jurisprudence until 1921, when he reached the university's retirement age. He was chairman of the world's congress on jurisprudence and law reform at the Columbian Exposition, Chicago, 1893; chairman of the conference on the foreign policy of the United States, Saratoga, N. Y., 1898; a lay delegate from the Methodist Episcopal Church to the General Conference of the Methodist Episcopal Church, South, in 1893; chairman of the Democratic State convention of Connecticut, 1904; chairman of the American Bar Association's section on legal education, 1893; president of the Association of American Law Schools, 1906; chairman of the judiciary committee in the Methodist general conferences, 1908, 1912 and 1916; chairman of the American Bar Association's committee on legal education, 1917; president of the New England States peace congress, 1910; official delegate from Connecticut to the National Conference on Uniform Laws, and to the International Prison Conference, Washington, 1910; President of the Civic Federation of New Haven, 1909-1911. He was the author of many important legal works and co-author of others. He was well known as an authority on legal history, and was a contributor to *The Princeton Review* and many reference works and other publications. He was awarded the honorary degree of Doctor of Laws by Wesleyan University and Northwestern University.

**ROMAN CATHOLIC CHURCH.** The Pope ended the year 1925 by sealing up the Holy Door in St. Peter's until the Jubilee in 1950, and then proclaimed the indulgence that might be gained by the world outside Rome during 1926. His activities during 1926 were numerous and important. From May to October there were nine formal ceremonies of beatification. In March he published an encyclical on missions, in which he exhorted all to join in their support and help secure the training of a native clergy. Another encyclical repudiated Fascist legislation and affirmed his right to freedom. The condition of the Catholics of Mexico gave him great concern, and in April he addressed to their bishops a letter advising patience and abstention from political factional strife. In May an encyclical on the seventh centenary of St. Francis of Assisi praised study of the saint's life and commended the order he founded. The allocution at the December 20 consistory condemned the Fascist idea which "makes state

an end unto itself," and again scored the "inhuman ferocity of the anti-Catholic persecutors in Mexico."

The Vatican relations with Prussia, France, the German Reich, Poland, Jugo-Slavia, Haiti, and Argentina were adjusted to a number of improvements. In France the political movement which centred in the paper *L'Action Française*, was condemned where it touched on doctrinal points. On October 24 the Pope consecrated six native Chinese bishops for the missions there.

**THE CARDINALS.** Six cardinals died during the year: Mercier, archbishop of Malines, January 13; Dalbor, archbishop of Burgos, February 14; Sili, of the Curia, February 27; Cagliero, of the Curia, February 28; and Touchet, bishop of Orléans, September 23. Four new cardinals were created; two at the consistory of June 21, Archbishop Luigi Capotosti and Mgr. Carlo Perosi; and two at the consistory of December 20, Giuseppe Gamba, archbishop of Turin, and Lorenzo Lauri, nuncio to Poland. This brought the membership of the Sacred College up to 67, divided into 37 Italian and 30 non-Italian cardinals.

**THE HIERARCHY.** In August the Pope created the new ecclesiastical province of San Antonio, Tex., with Bishop Arthur Drossaerts of San Antonio as its first archbishop, and the new diocese of Amarillo, Tex., with the Very Rev. Rudolph A. Gerken as the first bishop. The new archdiocese will have as its suffragan sees, in addition to Amarillo, those of Galveston, Corpus Christi, Dallas, and Oklahoma, and extends all over Oklahoma and Texas, except the diocese of El Paso, which is part of the province of Santa Fe. The diocese of Amarillo had a Catholic population of 24,550, 22 priests, 41 churches, and 10 schools, and includes more than 70 counties of the State of Texas. Bishop Edward D. Howard, auxiliary of Davenport, Iowa, was appointed archbishop of Oregon City, April 21; the Rev. Dr. Francis M. Kelly was appointed auxiliary bishop of Winona, Minn., March 21; the Rt. Rev. Mgr. Maurice L. McAuliffe was consecrated auxiliary of Hartford, Conn., May 4; the Rev. Dr. John J. Mitty was named bishop of Salt Lake, May 28; and Bishop Andrew J. Brennan, auxiliary of Scranton, to be bishop of Richmond, Va., in place of Bishop D. J. O'Connell, resigned; Bishop Joseph C. Pinten of Superior, Wis., was transferred to Grand Rapids, Mich., June 28, and July 6 the Rev. Dr. T. H. Reverman of Louisville, Ky., was named bishop of Superior; Bishop Augustin Schinner of Spokane resigned, and the Rev. Dr. Charles White of Grand Rapids, Mich., was appointed December 20 as his successor; Bishop Peter J. Hurth, C. S. C., of Nueva Segovia, Philippines, resigned. The Pope appointed, January 7, Mgr. Edward A. Mooney, the spiritual director of the American College, Rome, titular archbishop of Irenopolis, and sent him as apostolic delegate to India. Bishop George J. Caruana of Porto Rico was made titular archbishop of Sebaste and sent as apostolic delegate to the Antilles and Mexico. Mgr. Moses E. Kiley of Chicago succeeded Archbishop Mooney as spiritual director at the American College.

**DEATHS.** Bishop James J. Davis of Davenport, Iowa, December 2; Bishop Edward P. Allen, Mobile, Ala., October 21; Bishop Michael J. Hoban, Scranton, Pa., November 13; Bishop Joseph S. Glass, Salt Lake City, Utah, Janu-

ary 26; Bishop Edward D. Kelly, Grand Rapids, Mich., March 26; Bishop Frederick Eis (resigned), Marquette, Mich., May 5. Bishop William F. O'Hare, S. J., vicar apostolic of Jamaica, W. I., was drowned October 11; Archbishop John Cieplak, metropolitan of Wilna, Poland, died while on a visit to Passaic, N. J., February 17; Archbishop Paul E. Roy of Quebec, primate of Canada, died February 21; Bishop Raymond M. Rouleau, of Valleyfield, was appointed his successor, July 12.

Porto Rico was divided into two dioceses, the new see of Ponce being created. The apostolic vicarate of Darien, including the territory along the Panama Canal, with a residence at Colon, was organized.

**THE EUCHARISTIC CONGRESS.** One of the greatest religious assemblages in the history of the world was the 28th Eucharistic Congress, which convened at Chicago under patronage of Cardinal Mundelein, on June 21, and continued for four days. In attendance were 12 cardinals, 57 archbishops, 261 bishops, 3 apostolic delegates, 17 mitred abbots, 500 monsignori, several thousand priests, and a million pilgrims from all over the world. All the rites of the Church were represented, and twenty languages were spoken by the prelates present. The Pope was much interested in the Congress and sent to Chicago as his legate and special representative Cardinal Bonzano, former apostolic delegate to Washington. He and the other Cardinals, from Ireland, France, Spain, Germany, Austria, and Hungary, were enthusiastically welcomed in New York and on the road to Chicago. There, at the public reception to Cardinal Bonzano, a message of welcome from President Coolidge, in which the need of religion in the life of the nation was stressed, was delivered to him by Secretary of Labor Davis, representing the President. All the details of the formal programme were carried out successfully and the huge multitudes attending were handled without accident. The whole city, irrespective of race or creed, joined in the promotion of the attainment of the utmost perfection in the splendid ceremonies. The most notable of these were the "Children's Day," June 21, when 60,000 pupils of the Catholic schools were ranged in the Stadium of Soldiers' Field in Grant Park and sang the Mass of the Angels; the "Men's Night," June 22, when more than 100,000 men crowded the Stadium with lighted candles at Benediction; and the closing exercises of the Congress, the open-air mass celebrated by Cardinal Bonzano and the solemn procession that followed it, which took place on the shore of the lake, at the seminary at Mundelein, Ill., about 30 miles from Chicago. It was the greatest assemblage of people at an ecclesiastical event ever recorded.

After the Congress, five of the Cardinals and many of the prelates went to St. Louis, Mo., where they were present at the consecration of the new cathedral on June 29. The next Eucharistic Congress was to be held in Australia in 1928.

**STATISTICS.** According to the official Catholic Directory for 1926, these totals show the organization of the Catholic Church in the United States: archbishops, 15, of whom 4 were cardinals; 103 bishops; 24,352 priests, of whom 6671 belonged to the religious orders; 17,380 churches; 121 seminaries with 12,595 students;

218 colleges for men; 737 colleges and academies for women; 6819 parish schools, with 2,072,466 pupils; 352 orphan asylums, with 47,825 inmates; 117 homes for the aged; total Catholic population, 18,878,722. The gain for the year was 224,694, according to the Directory totals. The priests increased by 655; the churches, 96; seminaries, 1; colleges, 2; academies, 25; parish schools, 287; and pupils, 33,842.

The English Catholic Directory estimated the Catholics of the world at a total of 334,664,791. Of these 49,910,765 were in the English-speaking countries and 15,289,660 in the British Empire: England and Wales, 2,042,630; Ireland, 3,242,670; Scotland, 603,860; Canada, 3,633,663; Australia, 1,423,357. The increase was 10,884,631 over the previous year's figures.

**BISHOPS: ANNUAL MEETING.** The annual meeting of the hierarchy of the United States was held September 15-16, Cardinal O'Connell presiding. The bishops discussed the work of the Welfare Conference; Near East Relief; the missions; the Catholic University; a religious census; and the Mexican religious crisis. A letter of sympathy was sent to Mexican Catholics, praising their calmness, courage, and endurance under persecution. Cardinal Hayes was made chairman of a committee to address a pastoral letter from the hierarchy to the public that would be a formal expression on the situation in Mexico. This pastoral was published December 12, and was the first collective pastoral of the hierarchy since 1919.

**OTHER CONVENTIONS.** The convention of the Supreme Council of the Knights of Columbus (q.v.) met in Philadelphia, August 3-4. The Catholic Press Association Convention met in Detroit June 18-19; the Catholic Conference on Industrial Problems, in Cleveland, September 29-30; the Catholic Students' Mission Crusade at Dayton, Ohio, June 25-28; the International Federation of Catholic Alumnae at Notre Dame, Ind., September 6-8, and the National Catholic Alumni Federation at Philadelphia, Nov. 19-21.

**EDUCATION.** The 23rd annual convention of the Catholic Educational Association met at Louisville, Ky., June 28-July 1. A survey indicated that the Catholic colleges and universities had 73,674 students, an increase of 22.4 per cent during the period 1924-26. Of these, 39,869 were men and 33,805 were women. Catholic colleges for women in the United States had increased by 23 and the enrollment by 92 per cent in the years 1922-26. There were, in 1926, 711,705 instructors for the 2,313,183 students in the Catholic educational institutions in the United States. Three women's colleges had an attendance of 600; one had 1043 students; one 935; one 800; and the rest 500 or less.

**ROMANCE LITERATURE AND LANGUAGE.** See FRENCH LITERATURE; PHILOLOGY, MODERN.

**ROME, ITALY, RESTORATION OF.** See CITY PLANNING.

**ROSS, HUGH CAMPBELL.** British physician and director of the McFadden Research Foundation, died at sea December 14. He was born in 1875, and was educated at the Isle of Wight College and St. Thomas's Hospital. In 1898 he qualified as a physician, and traveled in Egypt and China. He served as a surgeon in the South African War, and received the Queen's medal with five clasps. From 1902 to 1906 he was a surgeon in the Royal Navy, where he was engaged in re-

search and laboratory work. As medical officer at Cairo, 1906-8, he started there a campaign of mosquito extermination, and in 1908 resumed his investigation of cellular pathology at the Royal Southern Hospital and School of Tropical Medicine, Liverpool. In 1910 he was appointed director of the McFadden Research Fund at the Lister Institute, Chelsea, and was engaged for several years in advising the Home Office on industrial cancer and on certain miners' diseases. Among his publications were *Induced Cell Reproduction and Cancer*, 1914, and many papers in the publications of the Royal Society, the Royal Society of Medicine, the Physiological Society, and medico-legal societies.

**ROSSI, AUGUSTE J.** American chemist, died at Niagara Falls, N. Y., September 19. He was born in Paris, France, Oct. 22, 1838, and was educated at institutions in that city. He arrived in New York at the age of 20, and for several years thereafter worked at blast furnaces. Dr. Rossi was the inventor of the process for the manufacture of titanium alloy and pigment and in 1918 he received the highest honor attainable in the United States by a chemist, the Perkin medal, for his valuable contributions to general scientific knowledge, and specifically for his alloy.

**ROTARY CLUBS.** Organizations established for the purposes of developing the highest ideal of unselfish service, of making practical application of that ideal to the business and professional life of the individual members, to organizations of which they may be members, and to the communities and nations in which they may live, and of advancing international peace and good-will through a fellowship of business and professional men of all nations united in the ideal of service. Membership in a club is limited to one representative of each business, profession, or institution in a community. The first Rotary Club was formed in Chicago, in 1905, by Paul Harris, a lawyer; three years later the second club was formed in San Francisco. In August, 1910, the first 16 clubs held a convention at Chicago to form a National Association, and in 1912 an International Association was formed to include clubs at Winnipeg, Canada, and London, England. On Oct. 1, 1926, the Rotary International consisted of 2412 clubs with an approximate membership of 123,000 in 35 countries. There were 1954 clubs in the United States, 84 clubs in Canada, 220 clubs in Great Britain and Ireland, and 154 in other parts of the world. The official publication of the organization is *The Rotarian*, a monthly printed at Chicago. *The Rotary Wheel* is the official publication for Great Britain and Ireland. Officers for 1926-27 were: President, Harry H. Rogers, San Antonio, Texas; first vice-president, Allen Street, Oklahoma City, Okla.; second vice-president, S. Kendrick Guernsey, Orlando, Fla.; third vice-president, James W. Davidson, Calgary, Canada; secretary, Chesley R. Perry, Chicago; treasurer, Rufus F. Chaplin, Chicago. Headquarters of the Rotary International are at 221 East Cullerton Street, Chicago, U. S. A., with a branch office at 12 Theaterstrasse, Zurich, Switzerland.

**ROUMANIA.** See RUMANIA.

**BOWING.** The college rowing laurels for 1926 went to the eight-oared crews of the University of Washington and Yale University. Washington nosed out the United States Naval

Academy after a gallant battle in the inter-collegiate regatta on the Hudson near Poughkeepsie, while Yale, for the sixth year in succession, took the measure of Harvard on the Thames near New London, Conn. Unfortunately, the question of supremacy as between Washington and Yale could not be settled, as these fine crews had no opportunity to pit their strength against each other.

Eight crews took part in the eight-oared event on the Hudson. Washington, the winner, covered the four-mile course in 19 minutes, 28½ seconds, the Naval Academy crew crossing the finishing line one second behind. Syracuse was third, Pennsylvania fourth and Columbia fifth. Washington also captured the junior eight-oared race, with Pennsylvania second and California third. The Columbia freshmen out-classed their rivals in the eight-oared yearling event, California finishing second and Syracuse third.

The 54th national championship regatta of the National Association of Amateur Oarsmen of America was held at Philadelphia, August 5, 6 and 7. The winners in the principal events were as follows: Senior eight-oared shells, Penn A. C.; intermediate eight-oared shells, New York A. C.; senior four-oared shells, with coxswain, Bachelor B. C.; senior doubles, Undine B. C.; championship single sculls, Walter M. Hoover.

Cambridge University for the fourth consecutive year defeated Oxford University in their annual race on the Thames, the winner's time for the 4¼ miles being 19 minutes, 29 seconds.

**ROZE, MARIE-HIPPOLYTE.** French dramatic soprano, died in Paris in June. She was born in Paris, Mar. 2, 1846, and received her first musical instruction on the piano from her mother. From 1862-5 she studied singing at the Conservatoire, under Mocker and Auber. On Aug. 16, 1865, she made her début at the Opéra Comique in the title rôle of Hérold's *Marie*, and sang at the Opéra Comique for three years. In 1870 she became a member of the Grand Opéra. Throughout the Franco-Prussian War she served as a nurse with the ambulance corps, and was decorated by President Thiers with the gold medal. She resumed her artistic career at Brussels and Amsterdam. During 1872-90 she sang, in London, at Drury Lane, Her Majesty's Theatre and Covent Garden, and with the Carl Rosa Opera Company. For two seasons she was also heard in New York, 1877-8 and 1880-1. In 1890 she retired from the stage, and settled in Paris as a teacher, but still appeared frequently in London in concerts until 1903. In 1874 she married an American basso, Julius Perkins, who died the next year. Her second marriage, in 1877, with Henry M. Mapleson, a son of the famous impresario, Colonel J. H. Mapleson, proved unhappy and ended in divorce.

**RUBBER.** The world's production of rubber for 1926 was estimated at from 600,000 to 615,000 tons, of which plantation rubber was by far the greatest amount. Based on a grand total of 600,000 tons for the year, the following distribution of the estimated production was made:

	Long tons
India and Burma .....	10,000
British North Borneo .....	5,000
Sarawak .....	9,000
French Indo-China .....	8,000
Siam .....	4,000
<b>Total .....</b>	<b>558,000</b>
<b>Wild rubber:</b>	
Amazon Valley .....	26,000
Mexico (Guayule Rubber) .....	4,000
Central America .....	3,000
Africa .....	9,000
<b>Total .....</b>	<b>42,000</b>
<b>Grand total .....</b>	<b>600,000</b>

The estimated consumption in 1926 was approximately 545,000 tons, distributed as follows:

	Long tons
United States .....	366,000
United Kingdom .....	40,000
France .....	85,000
Germany .....	25,000
Canada .....	20,000
Japan .....	15,000
Italy .....	12,000
Other .....	30,000
<b>Total .....</b>	<b>543,000</b>

In addition, the stocks held over from the previous year amounted to 75,000 tons.

In 1925 it had been estimated that the United States consumption, which in that year was 389,000 tons, would amount in 1926 to 400,000 tons, but this amount was not attained, and the *India Rubber World* placed its 1926 estimate at 359,414 tons and that for 1927 at 370,000 tons. There was increased consumption of reclaimed rubber in the United States, based on the improvement of processes which had improved the quality. Also, the high price of crude rubber figured extensively, so that in spite of prejudices, the reclaimed material was found available for many manufacturing processes. According to the United States Federal Census, the production of reclaimed rubber in the United States during 1925 was 110,841 long tons, which was an increase over 1923 of 85.1 per cent. This may be compared with the consumption of crude rubber given by the same census report, which was 387,629. In 1926 the consumption of reclaimed rubber was estimated by the *India Rubber World* at 164,000 tons, which was a substantial increase over that for 1925 and was said to account in part for the decline in the consumption of the crude. In 1927 the consumption of reclaimed rubber was estimated at 175,000 tons.

According to the compilation of the U. S. Rubber Association, the importations of crude rubber into the United States during the calendar year 1926 totalled 411,962 long tons, distributed as follows: Plantations, 386,748 tons; Paras, 13,184 tons; Africans, 3619 tons; Centrals, 4861 tons; Guayule, 3524 tons; Manicoba and Matte Grosso, 26 tons. Considering the importation by months, March held the record with 42,677 tons, while August showed the smallest imports, with 25,982 tons. Considering the arrivals of plantation rubber by ports during the year, New York received 356,307 tons, followed by Boston with 14,724 tons, Los Angeles with 9559 tons, and Baltimore with 4255 tons. During the year rubber prices in New York showed a general decline, in contrast with the increases

	Long tons
<b>Plantation rubber:</b>	
British Malaya .....	276,000
Ceylon .....	56,000
Dutch East Indies .....	190,000

recorded in the previous year. This decline started in December, 1925, when rubber sold at about \$1.10 a pound or slightly below the peak of \$1.20 in July, 1925, and at the end of December, 1925, the price was \$.90. In six months a price level of about \$.40 was attained and this continued throughout the year.

On August 5 the British Colonial Office in London stated that 21 pence would be retained as the determining point in the decision of restriction for the quarter beginning November 1. On October 25, however, new restriction rules were announced by the Colonial Office for the ensuing year, based on London quarterly average prices, as follows: Where the price was under 21 pence but not under 15 pence during any quarter the exportable percentage for the ensuing quarter was to be reduced by 10; where the reduction was from 100 per cent the reduced percentage was to be 80; if the price was not under 21 pence, but less than 24 pence, there was to be no change in the ensuing quarter; if, in each of the three consecutive quarters, the average was not under 21 pence the percentage for the ensuing quarter was to be increased by 10; where the price for any quarter was 24 pence or over the percentage was to be increased by 10 for the ensuing quarter; if the increase was from 80 per cent the increased percentage was to be 100; where the average descends below 15 pence in any quarter the percentage in the ensuing quarter was to be reduced to 60; if the average exceeded 26 pence in any quarter the percentage in the ensuing quarter was to be increased to 100. The percentage was to range in all cases below 100 and above 60.

During 1926 the United States re-exported crude rubber to the amount of 39,583,454 pounds (17,671 long tons), valued at \$22,470,583. The exports of rubber and rubber manufactures in 1926 totaled in value \$59,205,260 as against \$51,340,693 in 1925. The principal items of manufactured domestic rubber exported in 1926 were as follows:

Articles	Quantity	Value
Boots . . . . .	1,013,112 *	\$2,371,953
Shoes . . . . .	1,485,751 *	1,451,798
Canvas shoes with rubber soles	5,469,004 *	8,968,566
Tire casings . . . . .	1,497,132	24,358,907
Automobile tubes . . . . .	1,127,175	8,024,177
Solid tires . . . . .	1,649,128	3,959,969
Tire rubber accessories and repair materials . . . . .		1,612,074
Rubber belting . . . . .	4,175,810 *	2,657,086
Rubber hose . . . . .	6,124,960 *	2,523,402
Rubber packing . . . . .	2,149,387 *	1,096,985
Rubber soles and heels . . . . .	4,277,301 *	1,363,489
Rubber thread . . . . .	1,459,929 *	1,958,246

\* pairs, † pounds.

During the year the government of Liberia ratified a 99-year lease to the Firestone-Liberia Plantation Company of 1,000,000 acres of land in that republic which was selected by Harvey S. Firestone after investigating the rubber-growing possibilities in various countries of the world. This project was undertaken so that America would be able to grow its own rubber and not be dependent upon the British colonies and other countries. It was also announced late in the year that the harbor at Monrovia would be improved and various sanitary works put under way in preparation for the actual work in the jungle at which some 5000 natives were engaged at the end of the year. Mr. Firestone

announced that a maximum production of 200,000 tons of rubber annually would be raised in Liberia. During the year rubber was shipped to Akron, Ohio, from a 2000-acre plantation near Monrovia which had been abandoned by the British and taken over by the Firestone Co. See also CHEMISTRY, INDUSTRIAL.

**RUINS.** See ARCHÆOLOGY.

**RUMANIA.** The largest and northernmost of the Balkan states; separated from Hungary by the Carpathian Mountains and the Transylvanian Alps; bounded on the south by the Danube River and Bulgaria; on the east by Russia and the Black Sea; a constitutional monarchy. It is made up of the following divisions: The two old principalities of Wallachia and Moldavia (united in 1861); the Dobruja; Besarabia, ceded in March, 1918; Bukowina, in November, 1918; and Transylvania, in December, 1918. Area before the War, including territory taken from Bulgaria by the treaty of Bucharest, Aug. 7, 1913, 53,849 square miles; population, estimated in 1915, 7,904,104. Area after the War, 122,282 square miles; population, 17,393,149. Chief towns with their populations at the latest available dates; Bucharest, capital, 308,987 (1917); Chisinau, 114,100 (1914); Cernauti, 87,128 (1914); Ismail, 85,600 (1914); and Jassy, 76,121 (1914). The movement of population in 1924 was: Births, 622,580; deaths, 382,915; marriages, 154,173.

**PRODUCTION, ETC.** The chief grain crops are wheat, rye, barley, oats, and maize. No later statistics are available than those given in the preceding YEAR BOOK. (See table on Production by Countries in article AGRICULTURE.) A considerable acreage is devoted to vineyards, and tobacco is grown to some extent. The only industries of importance are flour milling, brewing, and distilling. The chief minerals are salt, iron, lignite, copper, and petroleum. The production of crude petroleum in 1925 amounted, to 2,316,504 metric tons, the highest figure in the history of the Rumanian industry and an advance of about 25 per cent over the 1924 production of 1,851,303 tons. The disposition of the petroleum output of 1913, 1924, and 1925 is shown in the following table:

#### DISPOSITION OF RUMANIAN PETROLEUM PRODUCTION [In metric tons]

Year	Production	Treated in refineries	Exported	Domestic consumption
1913 . . . . .	1,885,619	1,787,245	1,036,446	812,897
1924 . . . . .	1,851,303	1,644,144	435,504	870,017
1925 . . . . .	2,316,504	2,151,149	788,823	1,119,464

**COMMERCE.** The exports and imports for the year 1924, the last year for which complete statistics were available, were valued in lei as follows: Imports, 26,300,000,000; exports, 27,800,000,000, (1 leu equals at par \$.193; at average rate of exchange in 1926 \$.0046.) Exports from Rumania to the United States in 1925 were valued at \$561,585, as compared with \$150,887 in 1924 and with the previous high record of \$551,235 in 1922. The great increase over 1924 was characteristic of the wide fluctuation in the value of the trade since the War; but there was a tendency toward concentration on a few principal articles, and this should make for greater steadiness in the future. Walnuts were by far the most important item, being

valued at \$347,926 as against \$83,353 in 1924.

**FINANCE.** The budget bill for the fiscal year beginning Jan. 1, 1926, was finally passed in the form recommended by the Minister of Finance, and contained an additional 1,000,000,000 lei, which brought the total of the ordinary budget up to 29,250,000,000 lei. On the revenue side this addition is explained as a surplus carried forward from the 1925 budget; and on the expenditure side, as a fund for increasing the salaries of the state employees after July 1, 1926. The railway administration, for the first time excluded from the regular budget, was expected to become self-sustaining by the aid of a 30 per cent increase in rates; its estimated income and revenue balanced at a little more than 10,000,000,000 lei. The regular budget involved an increase in expenditure of approximately 6,000,000,000 lei over the corresponding allowances for 1925. The means counted on to provide the additional revenues included a new stamp tax, increased postal and telegraph charges, increased prices for products of state monopolies, more efficient application of existing taxes, and greater exploitation of the national wealth, including royalties from forests and mines. A decrease was indicated in the export tax receipts, which were estimated at 4,000,000 lei instead of the 5,000,000 of the 1925 budget. These export duties were still high (from \$6 to \$15 a ton on grains) and are a severe handicap to the normal development of Rumania's foreign trade.

**GOVERNMENT.** Under the constitution of Mar. 28, 1923, which nationalized all the forests and subsoil, executive power is vested in the king and a council of ministers, the king having a suspensive veto over the laws passed by parliament; and legislative power is vested in a senate of 170 members and a chamber of deputies of 347 members. The senate is composed of life members and various classes of officials; the deputies in the lower house are elected by all tax-paying citizens 21 years of age. The King in 1926 was Ferdinand I, born Aug. 24, 1865; succeeded his uncle, King Carol, Oct. 11, 1914. The ministry, as appointed Mar. 30, 1926, was as follows: Prime Minister, General Averescu; Interior, M. Goga; Foreign Affairs, M. Mitilineu; Agriculture, M. Garofid; Public Instruction, M. Negulescu; Finance, M. Lapedatu; Labor, M. Trancu; Public Worship, M. Goldis; Justice, M. Cucalbu; Industry and Commerce, General Coanda; Bessarabia, M. Nita; Bukowina, M. Popovici; War, General Mircescu; Communications, General Valeanu; Public Health and Social Welfare, M. Lupas.

**HISTORY.** At the very beginning of the year, all sorts of rumors were prevalent because of the renunciation of the rights of succession by Crown Prince Carol. His act was announced on the last day of 1925 at Bucharest, and was accepted by parliament Jan. 4, 1926. Michael, the four-year-old son of Carol, was named as heir apparent, and a committee of three was named to act as a regency in case King Ferdinand died before Michael became of age. The former crown prince promised not to return to Rumania for ten years. He resided in Milan, and, according to some, was merely biding his time until he could return to Rumania and overthrow the Bratiano régime and restore a really democratic government to the country. Others asserted that he took this action so that he could spend his

time freely with his formermorganatic wife, Zizi Lambrino. Prince Carol seemed very popular among the common people of Rumania. On January 24 the government announced that the parliament would be dissolved April 3.

Before the elections were held, the Bratiano ministry resigned, largely because of public dissatisfaction over the Carol affair, which was believed to have been hatched by Bratiano to strengthen his hold on the government. He was succeeded by General Averescu, the leader of the People's Party, who thus took charge of the elections held throughout the country May 25. Running true to form, the Averescu group, although controlling only a few members in the old parliament, succeeded in electing a majority of members of the new parliament. There is no doubt that the government saw to it that this result should be brought about. Most of the government's majority was piled up in the rural districts. The prime minister was able to accomplish this result largely because he was a member of the industrial oligarchy which has ruled Rumania for years. There is no such thing as genuine freedom of election, and frauds of all kinds were resorted to, in order to bring about the desired result. The same charges could be safely made against the régime of Bratiano. He and Averescu have been very successful in creating victorious political parties almost over night.

On September 30, Queen Marie left Bucharest for an extended trip through the United States and Canada. She sailed from Cherbourg October 12, after a meeting with Carol in which it was rumored that she had patched up his dynastic difficulties. After a 10,000-mile tour of the United States and Canada, Queen Marie sailed for home from New York, November 23. She was compelled to shorten her visit because of the reported serious illness of King Ferdinand. All kinds of rumors were in circulation concerning the reasons for the royal visit. The most common was the feeling that it was a preliminary to the raising of a huge loan in America for Rumania. This belief was not borne out by the close of the year, however. See ITALY.

**RUMANIAN LITERATURE.** See PHILOLOGY, MODERN.

**RUM SMUGGLING.** See PROHIBITION.

**RUSSELL SAGE FOUNDATION.** An institution established by Mrs. Russell Sage in memory of her husband. The endowment was \$10,000,000, to which \$5,000,000 was added by will. It was incorporated by an act of the Legislature of New York in April, 1907, for "the improvement of social and living conditions in the United States of America." The Foundation does not relieve individual need, but studies and interprets facts with regard to social conditions and methods of social work, makes the information available by publications, conferences, and other means of public education, and seeks in various ways to stimulate action for social betterment. The Trustees of the Foundation are: Robert W. de Forest, president; Lawson Purdy, vice-president and treasurer; John M. Glenn, secretary and general director; Frederic A. Delano, John H. Finley, Mrs. Frederic S. Lee, Dwight W. Morrow, Mrs. Finley J. Shepard and Harold T. White. During the year two trustees have died, Mrs. William B. Rice and Miss Louisa Lee Schuyler, both members of the Board since the organization of the Foundation.

The work of the Foundation is carried on through departments whose titles and directors are as follows: Charity Organization, Mary E. Richmond; Industrial Studies, Mary Van Kleeck; Publication and Library, Frederick W. Jenkins; Recreation, Lee F. Hammer; Remedial Loans, Leon Henderson; Statistics, Ralph G. Hurlin; Surveys and Exhibits, Shelby M. Harrison, who is also vice-general director of the Foundation. A consultation service on problems of Delinquency and Penology is under the direction of Hastings H. Hart.

During the year the Charity Organization Department continued its study of marriage administration. Through several committees in different parts of the country, the Director assisted and advised on the subject of marriage laws and their enforcement. The Department also carried on a correspondence service with a number of family welfare societies for the purpose of advising about their treatment of particularly difficult family situations. Case records were submitted by societies in 20 different cities. A Dutch translation of "*What is Social Case Work*," by Mary E. Richmond, had been published and a French edition of the book was in press at the end of the year.

As Consultant in Delinquency and Penology, Dr. Hastings H. Hart continued his studies of the detention of Federal prisoners in local jails. The report, *United States Prisoners in County Jails*, submitted by Dr. Hart, as Chairman of the Committee on Lockups, Municipal and County Jails, to the 55th congress of the American Prison Association, was published by the Foundation in 1926. It contains information of a sort never before compiled with reference to United States prisoners boarded out by the Federal government, showing the condition under which they are kept in county jails and the evils of the system. The recommendations of the Committee that the Federal government establish a jail system of its own and provide a training school for prison officials were accepted by the Association, which appointed a committee to further the realization of the suggestions.

Dr. Hart's advisory service with reference to this problem was continued. Advice was also given with reference to proposed jails in Cook County, Chicago; in Philadelphia, in Sumter County, South Carolina; and in Essex County, New Jersey. Dr. Hart assisted in a study of the Sangamon County Jail at Springfield, Illinois, and continued his service with reference to the proposed reorganization of the New York City Prison system. In May, 1926, upon the request of the Commissioner of Correction of the City of New York and the Warden of the Manhattan City Prison, known as "The Tombs," a detailed study was made of that institution. The report disclosed many unsatisfactory conditions and recommended changes relating in particular to quality, training and payment of the personnel.

Plans for industrial relations, which included some form of participation in management by wage-earners, continued to be the major interest of the Department of Industrial Studies. The Department was also carrying forward work for the improvement of statistics of employment and unemployment, and a study of methods of research in industrial relations, formulating its own experience as well as analyzing methods used in other similar investigations.

During the year, three reports were completed. The study, *Securing Employment for the Handicapped*, by Mary La Dame, was made at the request of a committee representing placement agencies for the handicapped for the purpose of better coördination of their work. The *Canadian Industrial Disputes Investigation Act*, by Ben M. Selekman, added to the material published by the Foundation in 1916 the facts of ten more years of experience. *Regularity of Employment in German Coal Mines*, by Sadie Engel, is an analysis of the situation in Germany and followed a report previously published by the Foundation on irregularity of employment in the bituminous coal mines of the United States.

The Department of Recreation has served in part as a section of the Social Division of the Regional Plan of New York and Its Environs. The chief work of the year was the preparation of two major reports which embodied the results of its several investigations. The purpose of the first study, called the *Neighborhood Unit*, was to provide a model for planning neighborhood sections in cities with adequate provision for business, residence and public facilities. The other, which summarized all the recreational resources of the region, provided an inventory of present facilities and suggested ways of increasing their usefulness and providing for future requirements. Robert K. Atkinson continued his experiments with physical training and recreation programme in selected institutions and organized courses of instruction for institution workers. Other activities of the Department had to do with community organization, physical tests of high school boys and girls, physical tests for use in citizen-military training camps, recreation in rural districts, recreation progress in New York City, the promotion of good sportsmanship and athletic badge tests, and motion pictures.

The Director of the Department of Remedial Loans visited most of the states in which the Uniform Small Loan Law or a similar law was operative to study the social effect of such legislation, and assisted movements looking toward the enactment of remedial loans legislation in 1927, especially in Missouri and Minnesota.

The Department was actively concerned with making plans for the elimination of the unregulated practice of so-called salary buying, a device for evading provisions of the Uniform Small Loan Law and usury laws, by a pretended purchase of earned wages. It assisted the promotion of credit unions in New York and published summaries of material in the New York State Banking Department's reports showing significant items in the increase of the credit union business.

Although editorial and statistical work for other departments of the Foundation accounted for a large share of the efforts of the Department of Statistics, several original investigations were carried on during 1926. These included the course of social work salaries since before the World War, the number and distribution of positions in social work in the United States; the trend of relief disbursements and the use of statistical measurements in family case work. As secretary of the Committee on Governmental Labor Statistics, the director was largely responsible for a report on methods of

compiling employment statistics which was made public during the year.

The Department of Surveys and Exhibits completed during the year a report on welfare problems in New York City for the Welfare Council of the city, listing 527 reports of social studies made from 1915 through 1925. *A Study of Social Publicity Methods* was also completed and the manuscript prepared for publication. Among other studies in process were the *Social Survey: A Bibliography*; and *Arts and Crafts of the Homelands*. Members of the Department served on a number of committees dealing with social surveys, research and methods of disseminating information of value in improving social conditions, and gave courses of lectures at Columbia University and at the New York School of Social Work. The Director of the Department gave part time as Director of the Social Survey Division of the Regional Plan, and in addition to the reports completed by the Department of Recreation, studies of density of land occupancy, housing and population were prepared.

The Library of the Foundation is open to all who are interested in social welfare. It contains about 26,000 bound volumes and 90,000 pamphlets. The attendance of readers and others reached a total of 22,306 in 1926. Six numbers of the bi-monthly bibliographical bulletin were issued on the following subjects: "Coöperative Housing," "Vagrancy," "Provisions for Care of the Aged," "Books on Social Subjects Published in 1925," "Social Case Work," and "American Foundations." There were also prepared 175 typewritten bibliographies, varying from a few titles to comprehensive lists, on social questions.

The Foundation continued to carry the cost of the preparation of the *Regional Plan of New York and Its Environs*. The Committee works through a series of divisions dealing respectively with public relations, engineering, studies in planning, architecture, economics and industry, of social and living conditions, and legal problems, all under the direction of Thomas Adams. Besides special reports in each field, the work of making a general regional plan based on a comprehensive and coordinated study of land uses and means of circulation throughout the area of 5528 square miles was proceeding. A Regional Council, composed of 141 individuals and representatives of planning agencies throughout the region, was organized, and planning commissions were appointed in 31 communities. During 1926 bulletins dealing with highways and parks on Long Island were issued, a statement submitted to the Mayor's City Planning and Survey Committee concerning the use of East River islands for recreational purposes, and pamphlets published on the *Origin and Destination of New York City's Vehicular Traffic* and on *Recent New York Legislation for the Planning of Unbuilt Areas*.

**RUSSIA.** A republic comprising the greater part of the former Russian Empire; officially entitled the Union of Soviet Socialist Republics. Capital, Moscow.

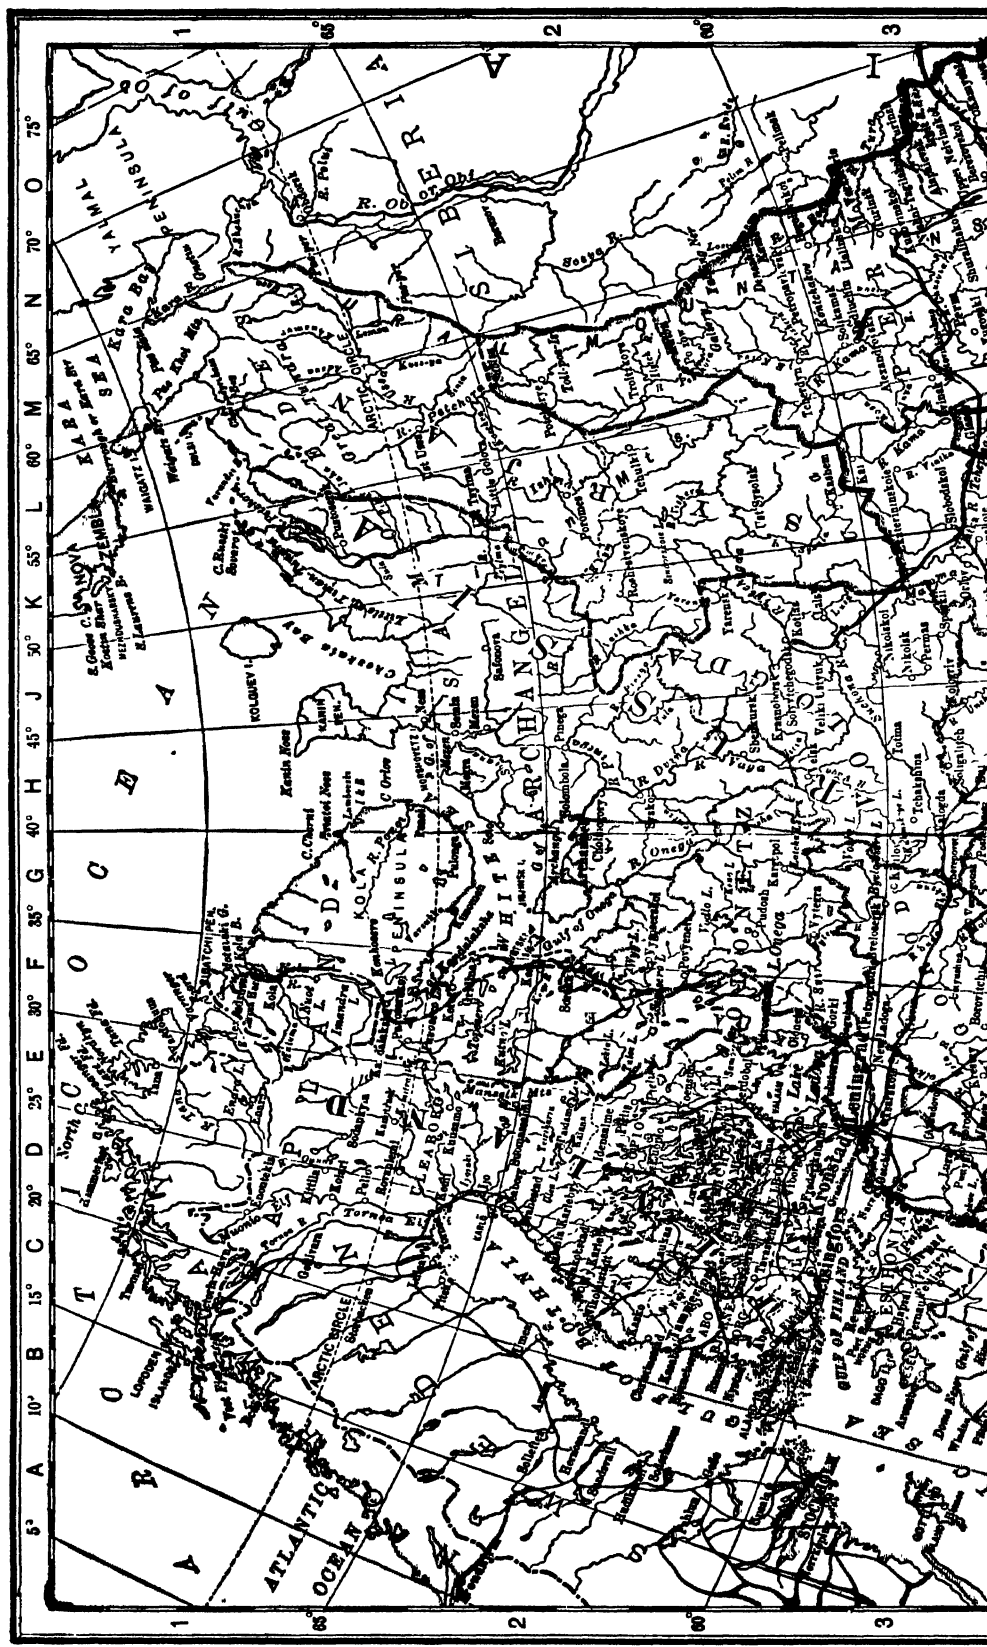

**AREA AND POPULATION.** According to the Russian Information Bureau, which supplied much of the material used in this article, the area of the Union of Soviet Socialist Republics was 8,200,000 square miles in January. On Jan. 1, 1926, the population of the Soviet Union exceeded the 1913 population in the same terri-

tory. The 1926 estimate was 141,400,000. In 1925 it was 138,781,000, and under the census of 1920 it was 131,000,000. Before the war it was 140,000,000. The gain in population is attributed largely to the steady reduction in the death rate, particularly from epidemic diseases. The death rate from typhoid in 1926 was a little over one-third of the pre-war rate and that from smallpox one-fourth. Of the 1926 population, 72,410,000 persons were classed as gainfully employed. These included 59,846,000 persons engaged in agriculture and 7,000,000 engaged in industry, transport and construction. The number of persons classed as living on independent incomes in the Soviet Union was estimated at 50,000. The number of unemployed in the estimates was 1,230,000. The total urban population was 23,700,000 and rural, 117,700,000. The Union of Soviet Socialist Republics is composed of six constituent republics as follows (with 1925 population figures): Russian Socialist Federated Soviet Republic, 95,787,942; White Russian Soviet Socialist Republic, 4,454,673; Ukrainian Soviet Socialist Republic, 27,243,222; Transcaucasian Federation, 5,577,155; Turkoman Soviet Socialist Republic, 914,558; and Uzbek Soviet Socialist Republic, 4,803,600. The largest union of the federation is the Russian Socialist Federated Soviet Republic, which consists of 10 autonomous republics, 13 autonomous regions, 3 areas, 44 provinces, 46 regions, 363 counties, 652 districts, and 3728 townships. The other members of the federation are divided up similarly into districts. According to recent data, Moscow, the capital, has 1,900,000 inhabitants, including 953,165 men and 946,835 women. The corresponding figures for 1913 were: 1,694,815 inhabitants, including 943,215 men and 811,685 women.

**EDUCATION.** Public education in the Soviet Union is a charge against the six constituent republics and against the localities concerned. Local appropriations are in the aggregate somewhat larger than those of the republican governments. At the date of going to press, the figures for the full appropriations for the Soviet Union for the fiscal year 1926-27 were not yet available. Appropriations, both state and local, for the R. S. F. S. R. (Soviet Russia proper, containing about 70 per cent of the population of the Union) were \$215,682,000, as compared with \$179,632,000 for 1925-26. In the fall of 1926, at the beginning of the school year, it was officially reported that 99 per cent of the children of school age in Moscow city were in school, and throughout Moscow province 94 per cent. See preceding YEAR BOOK for the latest school statistics.

**PRODUCTION, ETC.** Land and natural resources are held in trust by the government for the general population, and may not be acquired by private title. Every citizen is entitled to secure land for cultivation, the form of tenure being that of perpetual leasehold. Natural resources are exploited by the state trusts; by mixed companies, under concession, in which the state has a participating interest; or by private companies under concession. Such private concessions run for a limited period of years (generally 15). The transport system, and the posts, telephones and telegraphs, are operated as government departments. Industry is conducted largely by state trusts. Private factories employing not over 20 persons may operate with-

out formality. For enterprises employing from 21 to 100 persons permission of local authorities is necessary, and for larger enterprises a special leasing or concession agreement from the government is required. Many industrial enterprises are conducted by the coöperatives. Universal military service is incumbent on all. Non-producers (i.e., persons not engaged in socially useful work) may not vote and are exempt from army service.

Reports of the harvest received late in 1926 indicated a grain crop in the neighborhood of 2,800,000,000 bushels, or about 225,000,000 bushels greater than in 1925. This was close to the harvest of 1913, an average pre-war year, in the territory included in the present Soviet Union. The industrial crops, including cotton, sugar beets, oil seeds and potatoes, were well above the pre-war average, with the exception of cotton and sugar beets. Prolonged droughts in the cotton belt reduced the crop below the 1925 year. In October, 1926, 22,500 tractors were in use, as compared with 5000 in the spring of 1925. In 1926 the monthly figures of industrial production approximated those of 1913 and were showing a steady gain. In 1921 the monthly output was less than 15 per cent of that of 1913. The recovery was particularly rapid during 1925 and 1926, with the exception of a slowing up during a period of financial stringency during the winter of 1925. For the Soviet fiscal year ending Sept. 30, 1926, the value of industrial production was 41 per cent greater than during the fiscal year, 1924-25. State industry yielded a net profit for the year of \$231,750,000.

The total ascertained coal deposits in the Soviet Union were estimated at 428,000 million metric tons. By the autumn of 1926 the month-to-month figures of coal production equaled the pre-war rate. Coal production for the fiscal year 1925-26 was 24,302,200 metric tons, as compared with 16,083,500 tons in 1924-25 and 28,356,000 tons in 1913.

Oil production in the Soviet Union for the Soviet fiscal year ending Sept. 30, 1926, broke all post-war records, and oil exports for the fiscal year set an entirely new mark, being 10 per cent greater than the record exports of 1924-25 and nearly 60 per cent greater than the exports of 1913, an average pre-war year. Production for the fiscal year was 8,142,000 metric tons and exports were 1,450,000 metric tons. At the close of the year, during August and September, the monthly record of production became greater than the pre-war rate. Each month during the second half of the fiscal year the production figures showed an increase of between 3 and 4 per cent over the preceding month.

The increase in production for the year, as compared with 1924-25, was 17 per cent. New drillings in the fields amounted to 936,500 feet, as compared with 590,700 feet in 1924-25, an increase of nearly 60 per cent. The mechanical condition of the fields was materially advanced during the year, mechanization was extended and working efficiency improved. During the year upwards of \$55,000,000 was spent on new construction, replacements, etc. The Presidium of the Supreme Economic Council late in the year approved the control figures of the oil industry for the expenditure of \$73,516,000 on such development during the current fiscal year.

In productivity the oil fields of the Soviet Union rank third among producing countries, being surpassed only by those of the United States and Mexico. The oil reserves of the country, however, are easily the greatest in the world. At a conservative estimate these reserves are supposed to amount to approximately 2,000,000,000 metric tons, though this does not include a number of regions as yet inadequately investigated. The Baku and Grozny fields and those of the Emba-Ural district have been the most productive. Oil is also found in the Maikop district, in the Province of Kuban, at the western end of the Caucasus, on Tcheleken Island in the Caspian Sea, in the Ferghan district in Turkestan, on Sakhalin Island in the Pacific, and in other parts of the country, both in Europe and Asia. The Academy of Sciences of the Soviet Union was coöperating with the Soviet oil industry in exploring and charting new fields, and within the next few years a more comprehensive estimate of the oil resources than hitherto had been available may be expected. One of the interesting discoveries of rich oil-bearing lands during the year was made in the Novo-Grozny fields, north of Grozny proper.

A considerable increase was attained by the Soviet textile industry during the fiscal year 1925-26 (from Oct. 1, 1925, to Sept. 30, 1926), as compared with the preceding year. The cotton industry turned out 243,400 metric tons of yarn in 1925-26, as compared with 186,000 metric tons in 1924-25, and 2,131,000,000 meters of unfinished goods as against 1,595,400,000 meters in 1924-25. Thus, the total output of yarn increased by 30.9 per cent during the year, while the output of unfinished goods increased 33.6 per cent. The woolen industry turned out 32,800 metric tons of yarn in 1925-26, as against 27,700 metric tons in 1924-25, and 66,800,000 meters of unfinished goods as against 52,600,000 in 1924-25. In the linen industry the output of yarn increased by 31.9 per cent for the year, that of unfinished linen by 22.4 per cent and that of bags by 25.2 per cent. The production programme for 1926-27 (beginning Oct. 1, 1926) provides for the output of 2,380,000,000 meters of unfinished cotton goods, 190,000,000 meters of linen (including 61,000,000 bags), 35,000,000 meters of worsted goods, 18,000,000 meters of light woollens and 17,500,000 meters of heavy woollens.

The metal industry of the Soviet Union increased its output by 100 per cent in 1924-25 and by an additional 60 to 65 per cent in 1925-26. It was still considerably behind pre-war production, being the slowest industry to recover, though the output of agricultural machinery and several kinds of technical machinery in 1926 was above the pre-war production. Statistics of iron and steel production, in thousands of metric tons, follow:

	1925-26	1924-25	1913
Pig iron .....	2,221	1,292	4,206
Martin steel .....	2,918	1,868	4,247
Rolled iron .....	2,232	1,990	8,509

Production of iron ore for 1926 was 55 per cent of 1913. Production of manganese exceeded the pre-war rate by nearly 30 per cent. Both in the Chiaturi fields, operated by the Harri-man interests from the United States, and in the Nicopol fields, operated under the Soviet

trust system, substantial gains in production were shown during the year. The figures of manganese production in metric tons follow:

	1925-26	1924-25	1913
Nicopol .....	815,000	880,000	251,000
Chiaturi .....	772,000	436,000	970,000
Total .....	1,587,000	816,000	1,221,000

According to the U. S. Department of Commerce, the American imports of Chiaturi manganese for the period of the Soviet fiscal year ending Sept. 30, 1926, were 172,444 tons, valued at \$6,549,687.

COMMERCE. The foreign trade turnover at all frontiers is shown in the following table:

1918 .....	\$1,350,000,000
1922-23 .....	199,800,000
1923-24 .....	484,910,000
1924-25 .....	666,925,000
1925-26 .....	733,360,000

Exports for 1925-26 increased 16 per cent as compared with 1924-25, and imports increased 4.6 per cent.

The unfavorable trade balance for the fiscal year 1925-26 was \$45,268,500, as compared with \$79,670,500 in 1924-25.

A change to a favorable trade balance was effected in the fall of 1926. The monthly reports showed a marked favorable balance in September, October and November.

Some of the principal exports for the fiscal year 1925-26, in rubles, were as follows:

Exports	Rubles
Grain .....	156,011,000
Butter .....	80,850,000
Eggs .....	23,629,000
Timber .....	52,030,000
Seeds .....	14,181,000
Furs .....	63,818,000
Bristles .....	10,279,000
Manganese ore .....	21,285,000
Petroleum products .....	69,487,000
Flax and tow .....	44,822,000
Oil cake .....	23,673,000

Imports of production goods constituted 76 per cent of total imports, raw and half-finished materials having been imported to the value of 365,296,000 rubles (\$188,127,400).

During the fiscal year the foreign trade turnover on the European frontiers was as follows: Exports 589,100,000 rubles, imports 673,800,000 rubles, turnover 1,262,900,000 rubles (\$650,393,500).

The figures for American-Russian trade for 1913 and for the past three fiscal years are as follows:

	Exports to U. S.	Imports from U. S.
1913 .....	\$7,290,000	\$40,730,000
1923-24 .....	4,377,500	49,955,000
1924-25 .....	10,918,000	102,536,500
1925-26 .....	12,875,000	61,748,500

The principal Soviet imports from the United States during the past two Soviet fiscal years follow:

	1925-26	1924-25
Cotton .....	\$33,436,000	\$44,284,833
Agricultural machinery .....	8,088,000	8,000,000
Industrial machinery .....	6,819,300	7,100,000
Metals .....	2,034,400	1,240,000
Typewriters .....	558,432	675,250

The principal Soviet exports to the United States are furs, manganese, flax and tow, sheep casings, licorice root and bristles.

FINANCE. By the end of June, 1924, Soviet currency was established on a gold basis, and since that time there have been no paper issues.

Budgets of Soviet fiscal years, ending Sept. 30, in millions of rubles (1 ruble = \$.515):

	1922-23 (actual)	1923-24 (actual)	1924-25 (actual)	1925-26 (estimated)
Revenues .....	1460.0	2298.1	2905.1	4039.3
Expenditures .....	1463.5	2298.1	2875.6	3921.5

#### DETAIL OF REVENUES [Millions of rubles]

	1923-24	1924-25	1925-26
Ordinary revenue:			
Taxation and duties ..	788.5	1,344.3	1,889.9
Revenue from state enterprises and property .....	935.3	1,802.2	1,961.3
Extraordinary revenue:			
Loans .....	183.3	129.3	120.0
Silver and copper coins ..	74.4	80.0	30.0
Paper currency .....	126.3	....	....
Realization of state funds .....	80.6	24.3	28.1
Other revenue .....	139.5	....	....
Balance from previous budget .....	....	....	20.0
Total .....	2,289.1	2,905.1	4,039.3

According to the Commissariat of Finance, the state budget of the U. S. S. R. for the fiscal year 1926-27 provides for a revenue aggregating 4,758,500,000 rubles (\$2,450,627,500). This revenue is composed as follows:

	Millions of rubles
Direct taxes ..	762.7
Indirect taxes ..	1,280.0
Duties ..	173.3
Receipts from transportation and posts and telegraphs .....	1,810.6
Receipts from state industries .....	168.2
Receipts from state trading operations ..	30.2
Receipts from the exploitation of state forests ..	195.1
Other revenue ..	208.4
Internal loans ..	130.0
Total .....	4,758.5

According to preliminary data the internal state debt of the Soviet Union, as of Sept. 1, 1926, amounted to 640,058,000 rubles (\$329,629,870). This debt was divided into the following categories:

	Rubles
First lottery loan .....	109,000,000
Second lottery loan .....	52,200,000
8 per cent internal loan, 1924 ..	81,026,000
Peasant loan of 1924 .....	7,596,000
5 per cent short-term loan .....	201,000
Second peasant loan .....	78,875,000
Second 8 per cent loan .....	13,357,000
Short-term treasury bonds ..	82,573,000
Economic reconstruction loan ..	224,430,000
Total .....	640,058,000

RAILWAYS. In 1926 the railway mileage of Russia consisted of 46,157 miles of tracks, which was greater than the pre-war mileage of the country, despite the losses to the border countries where the Czarist government had built a network of strategic railways for the anti-

pated war with Germany. The volume of traffic was about 8 per cent of pre-war traffic. The number of locomotives in good order in August, 1926, was 10,818, as compared with 16,850 in 1913. Average daily freight car loadings in September, 1926, were 28,531, as compared with an average of 24,007 for the fiscal year 1925-26. The total revenues for 1925-26, according to preliminary figures, were \$659,200,000, as compared with \$476,332,000 the previous year.

Extensions to existing lines were being pushed steadily. Among the new lines being built is the south Siberian trunk line from Orsk to Barnaul, 1250 miles. The most important of the new lines to be begun in 1926 was a railway to run from Semipolatsk, in southwestern Siberia, almost directly south to Frunze (formerly Pishpek) in the cotton belt in Central Asia (882 miles). New construction was planned aggregating 1400 miles of line. A beginning was made in electrifying the suburban lines about Moscow and Leningrad, and an extensive electrification programme was arranged for the ensuing five years. While railway rolling stock was not up to pre-war standards, the equipment was being used more efficiently, as indicated by the following figures:

	1913	1924-25	1925-26
<i>Passenger traffic</i>			
Million passenger-kilometers	25,220	19,040	25,600
<i>Freight traffic</i>			
Million ton-kilometers . . . . .	65,670	47,414	67,580

These statistics indicate that in the year 1925-26 railway traffic was greater than before the war. The importation of rolling stock from abroad virtually ceased during the year, and 118 new locomotives built in Soviet plants were added to the system, along with 820 freight cars and 299 passenger cars. It was planned to build 350 new locomotives in 1927, and mass production of freight cars was being organized.

GOVERNMENT. A description of the constitution of the Union of Soviet Socialist Republics will be found in the YEAR BOOK for 1923. At the close of 1926, the Council of People's Commissars, the executive cabinet of the Soviet government, was composed as follows: Chairman of the Council of People's Commissars, Alexis I. Rykov; vice-chairmen of the council, A. D. Tsiurupa, J. E. Rudzutak, and V. V. Kuybyshev; commissar for army and navy, K. E. Voroshilov; for trade, A. I. Mikoyan; for foreign affairs, George Tchitcherine; for transportation, J. E. Rudzutak; for posts and telegraphs, I. N. Smirnov; for finance, N. P. Briukhanov; for labor, V. V. Schmidt; for peasants' and workers' inspection, G. K. Orjonikidze; chairman of Supreme Economic Council, V. V. Kuybyshev; Director of Central Statistical Administration, V. V. Obolensky (Ossinsky); Chairmen of the central executive committee of the Soviet Union, M. I. Kalin, G. I. Petrovsky, A. G. Cherviakov, Gazanfar Mussabekov, Netyrbay Aitakov, Faizulla Khodzhaev.

#### HISTORY

As noted in the preceding YEAR BOOK, the position of Stalin in Russian politics was considerably strengthened towards the close of 1925. His increase in power became more evident early in 1926 when L. B. Kamenev was

relieved of his position as vice-chairman of the council of people's commissars and was appointed people's commissar for foreign and domestic trade. Other changes were the relieving of G. Sokolnikov of his post as commissar of finances and the appointment of N. P. Briukhanov in his place, and the appointment of A. L. Sheinman to the position of chairman of the board of directors of the state bank. At the Communist International Conference which met at Moscow early in February, bitter attacks were made on American capitalism by Trotsky, who predicted that although the United States was the strongest capitalistic nation in the world it would not be immune from world revolution. Zinoviev, at the same conference, stated that crises were about to occur in several European countries, and he suggested the establishment of a federation of Socialist European states to fight the bulwark of capitalism in America.

The Russian Communists were, apparently, greatly disappointed by the early settlement of the general strike in Great Britain. A tremendous amount of money was collected in Russia to aid the cause of the British workmen, but it was officially refused by the British Labor Council. See GREAT BRITAIN, *History*. The relations between the two countries were severely strained for a time because of the evident desire of Russian labor to come to the financial aid of British labor.

DEATH OF DZERZHINSKY. On July 20 Russia was shocked to learn of the death of Felix E. Dzerzhinsky (q.v.), who had been one of the prime movers of the revolutionary period from the earliest days of its inception. When Lenin had instituted the changes in 1921 towards a capitalistic state, he placed Dzerzhinsky in charge of the supreme economic council. He had built up a reputation for himself, before this, as the head of the Cheka, the secret police of the Soviet government. On August 5 he was succeeded by Kuybyshev as head of the supreme economic council. The appointment of Kuybyshev left the control of Russian affairs in the hands of the so-called "big three," Stalin, Rykov, and Kuybyshev. Their position was considerably strengthened by the more or less forced retirement of Kamenev from the position to which he had been appointed at the beginning of the year. It was announced that he would spend his entire time preparing the biography of Lenin. His elimination marked the victory of Stalin and his semi-capitalistic theory of Communism over another of the extremists who bitterly fought any changes in the beliefs or practices of Sovietism. Those who were pushed aside by Stalin included Trotsky, Sokolnikov, Radek, Zinoviev, and Lashevich. Stalin believed in a gradual industrialization of the country by a policy of economy rather than by stripping the peasants and others of their property, as was advocated by his opponents.

THE EDDY REPORT. During August, a group of American business men and professional leaders made an exhaustive study of conditions as they existed in Russia. The report of this group was distinctly favorable to Soviet Russia. The members of the investigating committee were entirely unofficial in capacity and did not represent Socialist or Communist leanings. The report stated that there was no doubt about the stability of the Soviet government; in fact, it

stated that it was the most solid in Europe, its stability resting on the sagacity of the government, which although it made many errors, was quick to make changes necessary to make the Soviet experiment work. The report also gave glowing accounts of the economic progress of the régime, and stated that the welfare and social status of the people at large throughout the country had been greatly improved. The majority of the party favored recognition of the Bolshevik government by that of the United States. The argument was advanced that recognition of Russia by outside countries would weaken the power of the Third International, while failure to do so would merely tend to strengthen that body. Communistic propaganda, according to the report, could be more easily checked if Russian and foreign diplomats were exchanged and diplomatic pressure could be brought to bear against the Third International, which was not an official part of the Soviet government but was a body composed of representatives of 52 nations.

President Coolidge let it be known, through the press, that the Eddy report changed in no way his attitude toward recognition of Russia as enunciated in 1923, when he stated that the United States had no objections to private commercial dealings with Russia, but that it would not officially recognize a government that violated the sanctity of international obligations. After a very exciting session in Detroit, the American Federation of Labor, October 12, refused to adopt a resolution to recognize Russia, and, instead, adopted one which denounced the Soviet government "as the most unscrupulous, most anti-social, most menacing institution in the world to-day." The convention also rejected unanimously the proposal to send a labor delegation to Russia.

**SITUATION AT END OF YEAR.** The closing months of the year witnessed Stalin and his associates firmly entrenched in power. Trotsky and Zinoviev were reported as making conciliatory speeches in which they said that they had been opposed to the ideas of Stalin. The latter lost no time in meting out punishment. Trotsky and Zinoviev were virtually shorn of all power and positions in the party councils, and reduced to mere figureheads. Zinoviev was compelled to resign as chairman of the Communist International at its seventh session, which was held in Moscow in November.

**RUST, WHEAT.** See BOTANY, under *Plant Diseases*.

**RUTGERS UNIVERSITY.** A non-sectarian institution of higher education at New Brunswick, N. J.; founded under the name of Queen's College, in 1776. The university consists of the following colleges: Arts and sciences, engineering, agriculture, school of education, college for women. The registration for the fall term of 1926 was 1924, of whom 884 were women registered at the Women's College. The 1926 summer session had an enrollment of 1120. There were 148 members on the faculty, 88 of whom were instructors and 60 professors. The endowment funds, etc., amounted to \$1,800,000, and the income for the year to \$870,000. The library contained 135,000 volumes. President, John M. Thomas, D.D., Litt.D., LL.D.

**RYE.** The world's rye production in 1926, as indicated by estimates published by the International Institute of Agriculture, Rome, was

nearly 15 per cent below the production of 1925. The estimates for 1926 did not include the Soviet Republics, which reported a yield of 767,593,700 bushels in the preceding year. The estimated yields of the leading rye-growing countries in 1926 were reported as follows, in bushels: Germany, 295,097,900; Poland, 206,078,300; Czecho-Slovakia, 49,712,400; France, 33,310,000; Hungary, 30,015,300; Spain, 27,090,400; and Sweden, 23,542,000. Argentina, the leading rye country of South America, produced 4,733,300 bushels in the crop year 1925-26. The rye acreage for the different countries reporting was up to the average, and only about 2½ per cent under the acreage of the preceding year. Canada produced only 12,018,000 bushels as against 13,688,500 in 1925, with 20,423,500 as the average for the five-year period ending with 1924. The rye crop of the United States in 1926, according to estimates published by the Department of Agriculture, amounted to 40,024,000 bushels, the area to 3,513,000 acres, and the average yield to 11.4 bushels per acre. In 1925 the corresponding figures were 46,456,000 bushels, 3,974,000 acres and 11.7 bushels per acre.

Beginning with 1922, a progressive reduction of the rye acreage of the United States has taken place. The average farm price Dec. 1, 1926, was 83.5 cents per bushel, and on Dec. 1, 1925, 78.2 cents per bushel. Calculated at these bushel prices, the crop of 1926 was valued at \$33,416,000 and the crop of 1925 at \$36,340,000. The yields of the leading rye-producing States in 1926 were reported as follows, in bushels: North Dakota, 9,287,000; Minnesota, 4,954,000; Wisconsin, 3,840,000; Michigan, 2,686,000; Nebraska, 2,608,000; and Indiana, 2,102,000. Only five other States—Pennsylvania, North Carolina, Montana, Illinois and Colorado, given in decreasing order of yield—produced more than 1,000,000 bushels each. North Dakota led in acreage with 1,222,000 acres, followed by Minnesota with 367,000 acres. The average farm price per bushel in the different States ranged, on Dec. 1, 1926, from 67 cents in Wyoming to \$1.75 in South Carolina. For the year ended June 30, 1926, the United States exported 12,505,000 bushels of rye and 24,000 barrels of rye flour as compared with 49,909,000 bushels and 55,000 barrels during the preceding fiscal year. The foregoing information is taken from Wheat and Rye Statistics, *United States Department of Agriculture Statistical Bul. No. 12*, Washington, 1926.

**SAAR BASIN.** *zür.* According to Article 45 of the Treaty of Versailles, this section of Germany was awarded to France for the purpose of exclusive exploitation of the coal fields, in compensation for the destruction of the coal fields in northern France by the German armies. The treaty provided that for 15 years the Saar Basin should be governed by a commission of five appointed by the League of Nations, and that after that period the population should decide on one of three courses; namely, the administration set up by the treaty, union with France, or union with Germany. Area, 751 square miles; population, about 657,870.

**SACKETT, WILLIAM EDGAR.** American editor, died at East Orange, N. J., November 18. He was born in New York, May 23, 1848, and was educated at the Anthon School and at the New York Free Academy (later the College of the City of New York). From 1865 to 1868 he

studied in the law office of Chester A. Arthur, later President of the United States. Journalistic work appealed to him, and in 1874 he took charge of the New Jersey bureau of the *New York Times*, in which position he remained eight years. He then established in Jersey City the *Sunday Morning News*, later converted into the *Jersey City Daily News*. This connection, however, lasted but one year, and in 1885 he became New Jersey editor of the *New York Herald*. In 1896, however, he resigned this position and went to Washington as a political reporter. During the war with Spain he was on the *Herald* staff, and at the conclusion of hostilities acted for two years as secretary of the United States Industrial Commission. After 1908, he devoted himself to studies in political history and to writing special articles on public affairs. In 1920 he rejoined the staff of the *New York Times* and remained a member until his death. He published *Modern Battles of Trenton*, and *How Wilson Became President*, a work which shows clearly how intimately he was concerned with the political world and struggles of his time. The work, *New Jersey's First Citizen*, published in 1917, was edited by Mr. Sackett.

**SAFETY, INDUSTRIAL.** See NATIONAL SAFETY COUNCIL.

**SAFETY AT SEA.** The United States Steamboat Inspection Service of the Department of Commerce, for the fiscal year ended June 30, 1926, reported a total of 314 accidents resulting in the loss of 368 lives, of which 103 were those of passengers. Of the losses, 212 were fairly chargeable to accidents, collisions, foundering, and so forth, or an increase of 58 in the number of lives lost as compared with the previous fiscal year. Passengers to the number of 350,370,065 were carried on vessels required by law to make report of the number of passengers transported, so that it would appear that 3,401,651 passengers were carried for each passenger lost. The number of lives directly saved by means of the life-saving appliances required by law was 752.

The Steamboat Inspection Service inspected and certificated during the fiscal year 7377 vessels with a total gross tonnage of 15,016,556, of which 7055 were domestic vessels with a gross tonnage of 11,619,240, and 322 foreign passenger vessels with a gross tonnage of 3,397,316. Of the domestic vessels there were 5581 steam vessels, 950 motor vessels, 18 passenger barges, and 506 seagoing barges. There was a decrease of 34 in the total number of vessels inspected, and an increase of 472,403 in the total gross tonnage of vessels inspected as compared with the previous fiscal year. There were 1000 cargo vessels examined to carry persons in addition to crew under the act of Congress approved June 5, 1920. Letters of approval of designs of boilers, engines, and other operating machinery were granted to 20 steam vessels, with a total gross tonnage of 707. There were inspected for the United States Government 73 hulls of vessels and 2009 boilers. There were 2575 reinspections of steam vessels, motor vessels and barges, the report states.

The following disasters during the fiscal year resulted in an unusually large loss of life:

Aug. 18, 1925. The boiler of the steamer *Mackinac*, of 515 gross tons, exploded off Codding Point, Newport, R. I., at 6 P. M. There were 677 excursionists on board. Fifty-three

lives were lost and about 100 persons injured.

Nov. 5, 1925. The barge *J. L. Crane* broke adrift from the steamer *Herman H. Hettler* during a northwest gale and high seas, when near Crisp Point, Lake Superior, and, with its crew of seven, was lost.

Nov. 15, 1925. The towing steamer *Barryton*, of 418 gross tons, en route from Cleveland, Ohio, to Buffalo, N. Y., with four barges in tow, encountered a heavy gale, which broke up the tow, and the canal barges *Anna O'Connor*, *Jerry B. Petrie*, and *Sherman V. Petrie*, which became separated from the tow, were wrecked on Buffalo breakwater, with a loss of four lives.

Nov. 29, 1925. The steamship *Ootopawi*, of 2351 gross tons, sailed from Charleston, S. C., for Havana, Cuba, with a cargo of coal. Was last heard from on November 30, and is supposed to have been lost with all hands on board in the storm that was raging on the Atlantic coast between Nov. 30 and Dec. 5, 1925. Thirty-two men were on the vessel.

Jan. 8, 1926. The towing steamer *Goliah*, while bound from Norfolk, Va., to New York, towing barges *Ormond*, *T. J. Hooper*, and *Sherwood*, loaded with coal, became separated from the barges, and stood offshore for safety. The barges anchored. When the tug returned to the barges it was found that the barges *Ormond* and *T. J. Hooper* had sunk. There were four persons on each barge that sank, who were drowned, making a total of eight persons lost.

Jan. 28-29, 1926. The barges *Bronx No. 1* and *Severan*, while being towed by the steamer *W. F. Mattich* from Morehead City, N. C., to Georgetown, S. C., were sunk during a storm while between 3 and 4 miles southeast of Frying Pan Lightship. Four lives were lost.

Feb. 1, 1926. The steamer *Battleboro*, of 426 gross tons, left Hampton Roads bound for New York with the barges *Absecon*, *Henlopen*, and *Searsport* in tow. At 5 A. M., in a gale and snowstorm, hawser between tug and head barge parted. Tug headed for sea and returned to barges. The *Absecon* and *Henlopen* anchored at Barnegat gas buoy and were found abandoned. The tug *Liberty* towed the *Henlopen* to New York, and the *Battleboro* towed the *Absecon* to New York. The *Searsport* was not found and is supposed to have foundered, and the crew of four men was lost.

Feb. 3, 1926. The towing steamer *Georges Creek* from Newport News, Va., to Boston, Mass., encountered heavy weather northeast of Brigantine Buoy, N. J., and was compelled to cast off the tow and put to sea. When the wind changed the tug made every effort to pick up the barges but without success. The barges, three in number, had a crew of three men each. Two were rescued by the Coast Guard and the remaining seven lost their lives.

Apr. 8, 1926. The steamer *O. T. Waring*, of 5579 gross tons, while lying at Jahneke's dry dock, New Orleans, La., exploded, took fire, and eight lives were lost and 42 men were injured.

Apr. 11, 1926. The motor ship *Gulf of Venezuela*, of 6661 gross tons, while lying at the dock of Gulf Refining Co., Port Arthur, Tex., and taking on a cargo of high-test gasoline, experienced an explosion of gasoline, which swept the vessel and destroyed the superstructure, resulting in the death of 31 members of the crew.

In addition to the disasters recorded by the

United States Steamboat Inspection Service, there were a number of serious wrecks or catastrophes during the year, of which the following are worthy of notice:

Jan. 26, 1926. The British freight steamer *Antinoe* was lost in a storm in the North Atlantic, after the American liner *President Roosevelt* had taken off her crew in four days of rescue work, losing two men and five boats in the effort.

Jan. 27, 1926. The British freighter *Laristan* sank in the same storm in the North Atlantic, 24 of her crew being lost and six rescued by the *Bremen*.

Mar. 10, 1926. Fire occurred on the liner *America* while at her dock at Newport News, causing damage estimated at \$2,000,000.

Mar. 13, 1926. The American freighter *Suduffoo* left Port Newark for the Pacific Coast with a crew of 28, and was never heard from.

Mar. 22, 1926. The Brazilian steamer *Pas de Carvalho* took fire and blew up on the Solimoes River, near Manaus, resulting in the loss of 38 lives.

Apr. 27, 1926. The passenger steamer *Chichibu* grounded in a storm off Horomushiro, Japan, and 230 lives were lost.

Aug. 28, 1926. The passenger steamboat *Buryvestnik* crashed into a river pier near Cronstadt, Russia, and sank, causing the death of 300.

Oct. 22, 1926. The British sloop of war *Valerian* sank in a hurricane off the Bermuda coast, when bound to Bermuda from the Bahamas. It was said that if the ship had been able to obtain sufficient coal to put on speed, she could have reached Bermuda before the storm broke. About 80 lives were lost, and 18 were saved, after a day and night on rafts, by the *Capetown*.

Dec. 25, 1926. The French barque *Eugène Schneider* sank when it was struck amidships by the British steamer *Buruta* in the English Channel, and 24 of its crew of 28 were lost.

**ST. CHRISTOPHER** or **ST. KITTS**. See **LESWARD ISLANDS**.

**ST. DAVIDS**, BISHOP OF. See **OWEN**, RT. REV. JOHN.

**ST. HELENA**. An island of volcanic origin in the South Atlantic, about 1200 miles from the west coast of Africa, and belonging to Great Britain. Area, 47 square miles; population, according to the census of 1921, 3747; estimated civil population, Dec. 31, 1924, 3703. Capital and seaport, Jamestown. The chief occupation is the fibre industry, and fibre and tow are the principal exports. In 1924 the exports were valued at £36,160 and the imports at £51,421; revenue £12,699, expenditure, £14,182; there is no public debt. A detachment of the Royal Marine Artillery is stationed on the island, which is also a coaling station for the British Navy. Governor in 1926, C. H. Harper.

**ST. JOHN'S COLLEGE**. A college of liberal arts and sciences at Annapolis, Maryland; founded in 1696. The enrollment for the fall term of 1926 was 172, and the number on the faculty was 25. The endowment funds amounted to \$122,300, and the yearly income to \$124,931.77. The College grants the A.B. degree only. Freshmen were given orientation courses in literature and the social sciences. The R.O.-T.C. unit was discontinued during 1926. The

library contained 14,102 volumes. President, Enoch Barton Garey, LL.D.

**ST. LAWRENCE UNIVERSITY**. A coeducational institution of higher education at Canton, N. Y.; founded in 1856. The registration for the fall term of 1926 was 2938, distributed as follows: College of letters and science, 595; theological school, 27; law school, 2244; school of agriculture, 72. The faculty numbered 97, divided among the several schools as follows: Letters and science, 34, 3 of whom were additions during 1926; theological, 4; law, 30; agriculture, 14; special lecturers, 15. The college endowment fund was \$1,741,011.23, and the income for the year \$155,985.86. The library contained 52,000 volumes. New buildings erected during the year were Gunnison Memorial Chapel, Hepburn Hall of Chemistry, Brewer Field House, and Gaines Out-door Theatre. A central heating plant was installed and a women's dormitory begun. President, Richard Eddy Sykes, D.D.

**ST. LUCIA**, loo'shi-ä. A British insular colony in the Windward group of the West Indies. Area, 233 square miles; population in 1924, 54,304. Castries, the chief port and capital, is a naval base and coaling station. The movement of population in 1924 was: Births, 2061; deaths, 1282; marriages, 238. On Dec. 31, 1924, there were 42 Roman Catholic and 7 Protestant schools, with 7611 pupils enrolled. The chief products are cacao, sugar, lime juice, lime oil, bay oil, honey, hides, logwood, rum, fuel, molasses, and syrup. Imports in 1924 were valued at £234,647; exports, at £233,965. Of the imports the largest share came from the United States and of the exports the largest share went to Great Britain. The total shipping in the same year was 966,113 tons, of which 738,171 tons were British. Revenue in 1924, £72,888; expenditure, £89,990; public debt, £143,530. The island is under an administrator aided by a nominated executive and a partly nominated and partly elected Legislative Council. Administrator in 1926, Lieut-Col. W. B. Davidson-Houston.

**ST. PIERRE AND MIQUELON**, më-ke-lôn'. Two small groups of islands belonging to France, close to the northern coast of Newfoundland, and named from their two largest islands. Area of the St. Pierre group, 10 square miles; population in 1921, 3419; area of the Miquelon group, 83 square miles; population in 1921, 499. The islands are rocky and unsuited to agriculture, their main importance being as a centre for the cod-fishing industry. The chief town is St. Pierre, which has regular steamship communication with North Sydney and Halifax. In 1924 the imports totaled 149,075,555 francs; the exports, 142,804,699 francs. The imports consisted chiefly of textiles, salt, wines, foodstuffs, and meat; the exports, cod, dried and fresh, and fish products. The local budget for 1925 was: Revenue, 10,549,610 francs; expenditure, 10,058,735 francs. The islands are under a governor aided by consultative and municipal councils.

**ST. THOMAS**. See **SÃO THOMÉ AND PRINCEPE**.

**ST. VINCENT**. A British insular colony in the Windward group of the West Indies. Area, 150.3 square miles; population in 1924, 47,591. Kingstown, with a population of 3836 in 1921, is the capital. The movement of population in 1924 was: Births, 1795; deaths, 785; marriages, 114. In the same year there were 27 primary

schools with an average attendance of 2639. The chief products are arrowroot, sugar, cotton, rum, cacao and spice; cotton (Sea Island) being especially important and regarded as the best grown in the British Empire. Although much of the cultivated land is still held by large proprietors, a large number of small holdings under peasant proprietors have lately been established under the auspices of the government. In 1924 the imports were valued at £160,028; exports £150,862; revenue, £60,893; expenditure, £53,887; public debt, £10,850; total shipping, 476,434 tons. One-half of the Grenadine islands are under the administration of the island of St. Vincent and the other half under Grenada (q.v.). At the head of the administration is an administrator and colonial secretary, who is aided by a legislative council consisting of official, elected, and nominated members. Administrator in 1920, R. Walter.

**SAKHALIN**, sã'kã-lyen'. An island off the eastern coast of Siberia, separated from Japan by the narrow strait of Soya. The portion south of the 50th parallel of N. latitude belongs to Japan; north of that line lies the province of Sakhalin, belonging to Russia. Japanese Sakhalin, or Karafuto (q.v.), has an area of about 13,934 square miles and had an estimated population in 1924 of 169,300. The area of the Russian province is 14,688 square miles, with a population estimated at 34,000 in 1915. The northern half is covered with forests to the extent of 80 per cent of the entire area. A small portion of the northern area is not fitted for the growth of trees because of the climate. Most of the trees are pines suitable for building lumber, which is transported by rafting.

**SALEM, MASS., ANNIVERSARY.** See CELEBRATIONS.

**SALVADOR**, sãl'vã-dör'. A Central American republic, situated to the east of Guatemala on the Pacific coast. Capital, San Salvador.

**AREA, POPULATION, ETC.** The area is estimated at 13,176 square miles; the population on Jan. 1, 1924, was estimated at 1,580,000. The mestizos or mixed races numbered 1,184,000 and the Indians 316,000. San Salvador had a population of 84,315 at the census of 1923. Other large towns with their populations at the same time are: Santa Ana, 72,285; San Miguel, 35,546; Santa Tecla, 27,279; San Vicente, 31,927; and Sonsonate, 16,283. In 1924 there were 60,591 births and 33,047 deaths. Education is free and compulsory. According to the president's message, in 1925 there were 826 schools giving primary instruction, employing 1465 teachers. The enrollment was 49,749 and the average attendance 33,875. A comparison of these statistics with those of the previous year shows an increase of 93 schools, 332 teachers, 4570 pupils enrolled and 3801 in average attendance. There are also secondary schools and a National University with faculties in jurisprudence, medicine, pharmacy, dentistry, and engineering.

**PRODUCTION.** The principal occupation of the country is agriculture, and coffee is the chief crop. Other agricultural crops are cacao, rubber, tobacco, sugar, and cotton. The mineral wealth of the republic includes gold, silver, copper, iron and mercury.

**COMMERCE.** Salvador's total exportation for the year 1925 was valued at \$16,900,000, as compared with \$24,300,000 in 1924, while the total importation was \$16,600,000, as compared

with \$11,000,000 in 1924. Although the balance of trade was not so satisfactory as in some previous years, it still remained favorable by approximately \$300,000. The decrease in exports may be accounted for by the small coffee crop harvested, coffee comprising about 90 per cent of Salvador's exports. The exports from Salvador to the United States were estimated to have fallen off 40 per cent in 1925 as compared with the previous year. Imports from the United States increased by approximately 40 per cent, owing largely to shipments of construction materials, railway equipment, and building supplies.

#### SALVADOR'S EXPORTS BY COMMODITIES

Product	1923 Kilos	1924 Kilos	1925 Kilos
Coffee .....	41,994,124	48,808,831	32,068,920

**FINANCE.** Estimates of Salvador's revenues for 1925-26 were higher than they have ever been before, and were calculated at 18,205,860 colones, as compared with 16,464,024 colones for the fiscal year 1924-25. Expenditures as provided in the budget totaled 18,166,714 colones, against 16,414,032 colones in the previous year.

**COMMUNICATIONS.** In 1924, 576 steamers with a tonnage of 1,117,707 entered at the ports of Salvador. In the summer it was reported that the connection of Salvador with Guatemala by the International Railways of Central America had progressed considerably. On the San Salvador-Teixistepeque line, a total distance of about 57 miles, about 35 miles of track had been laid, and it was expected that the line would be completed by September, 1926. On the Santa Ana-Ahuachapan line (27 miles long) 50 per cent of the work had been completed, and it was estimated that the work would be completed by the end of February, 1927. On the Santa Ana-Guatemalan border line, via Teixistepeque, 38 miles long, 60 per cent of the work had been finished and it was estimated that it would be entirely completed by June, 1927.

**GOVERNMENT.** Under the constitution, executive power is vested in a president elected for four years, who acts through a ministry of four members; and legislative power in a congress of 42 members elected for one year by universal suffrage. President, Dr. Alfonso Quinonez Molina (assumed office, Mar. 1, 1923).

**HISTORY.** On February 22, a treaty of friendship, commerce, and consular rights was signed between Salvador and the United States. On May 19 the president of the republic approved the legislative decree of May 8 calling for a constitutional assembly for the purpose of amending the constitution of 1886.

**SALVATION ARMY.** An international organization with headquarters in London, England, whose purpose is the "salvation of mankind from all forms of moral, spiritual, and

temporal distress." The movement was organized in 1865 by William Booth, a minister of the English "New Connection Methodists." In 1881 it spread to the United States, and was incorporated in New York in 1899. Its creed is in general Arminian, but it gives little attention to the discussion of doctrinal differences, being more actively concerned in philanthropic endeavor. The organization of its government is military in character (in 1926 it was under the command of General Bramwell Booth), although each country has its own organization under the direction of a commissioner, and each local corps is under the command of a captain and a lieutenant. The Army in the United States is divided into four territories, with headquarters at New York, Chicago, San Francisco, and Atlanta, the last named having been organized during 1926. Each territory maintains a training college for men and women at its headquarters. Each of the territories issues a weekly periodical, the *War Cry*, the new *Southern War Cry* having started during the year. The Army also conducts extensive welfare work for children at many institutions throughout the United States, particularly at the Lytton Springs Orphanage and Industrial Farm in California. In 1926 there were 4614 officers and cadets; 47,753 senior soldiers; 27,033 junior soldiers; 2903 recruits, or a total membership of 82,303. Converts during 1925 totaled 120,388. Field statistics give 1955 corps and outposts; 4614 officers and cadets; 22,400 local officers and bandsmen. There were 15 hospitals and dispensaries conducted by the Army, which during the year rendered service to over 46,988 patients. Other institutions included 106 industrial homes; 97 free employment bureaus; 9 children's homes; 33 homes and maternity hospitals; and 71 hotels and 12 women's boarding homes.

Valuable work was conducted by Army workers in the prisons; there were 7455 prisoners assisted upon discharge, and 491 paroled to the Army. The following statistics for 1926 indicate the general nature and scope of the relief work carried on by the organization: Christmas dinners (1925), 398,162; persons afforded temporary relief outside Industrial Homes and Hotels, 2,118,042; mothers given summer outings, 9649; children given summer outings, 46,982; pounds of ice distributed 187,101; pounds of coal distributed, 3,002,833. There were 509,949 indoor meetings held during the year 1925 and 222,544 open air meetings; the total attendance was reported as 43,380,485. Similar activities are carried on by the Salvation Army in 81 countries and colonies. The National Headquarters is at 122 West 14th Street, New York, and Commander Evangeline Booth is the National Leader. The American Territorial Commissioners are: Richard E. Holz (Eastern), John McMillan (Central), Adam Gifford (Western), and William McIntyre (Southern).

**SALZBURG.** A province of the Austrian republic; before the war a crownland of the Austro-Hungarian Empire. Area, 2762 square miles; population, according to the census of 1923, 223,023. Capital, Salzburg, with a population in 1923 of 37,856.

**SAMOA.** A group of 14 islands in the Pacific Ocean, between 13° and 15° S. latitude and 168° and 173° W. longitude, about 2000 miles south of Hawaii and 4000 miles southwest of San Francisco. Since Feb. 13, 1900, the islands

east of 171° W. longitude have belonged to the United States; and the islands west of that line belonged to Germany until the outbreak of the war in 1914, when they were occupied by the British and later turned over to New Zealand for administration, under a mandate of the League of Nations.

The official name applied to the former German Samoan Islands is Western Samoa. This territory includes Savaii and Upolu, two of the largest islands, and Apolima and Manono. Area of Savaii, about 660 square miles; Upolu, 550 to 600 square miles. The principal port is Apia, on the island of Upolu. Population, March, 1925, 38,230, of whom 2176 were Europeans and half-castes, and 752 coolie laborers. About 13,000 pupils are instructed in schools conducted by the government and various missionary groups. The products include copra (the chief product), cacao, rubber, sugar, and cardamoms. The imports for 1924 were valued at £274,803; exports £361,418. The principal source of imports was Australia and the chief destination of exports was Great Britain. In the same year 81 vessels of 103,122 tons entered and cleared at the port of Apia. The revenue collected for the year ended Mar. 31, 1925, was £130,914; expenditure, £135,523. The general control of the islands is under the New Zealand ministry, and the local government is under an administrator. Administrator at the beginning of 1926, Maj.-Gen. Sir George Richardson.

Tutuila, Tau, and the Manua group comprise the American Samoan group of islands. The total area of the islands is about 58 square miles; and the population, according to the census of 1922, is 6125. The principal port is Pago-Pago, at the extreme end of the bay of the same name on the island of Tutuila, the best and safest harbor in the South Seas. The soil is very fertile. There is an abundance of copra, which is the only article exported, and a variety of fruits, including oranges, limes, bananas, mangoes, and alligator pears. The United States Navy has established a high-powered radio station on the island of Tutuila, which is in daily communication with the islands of the Pacific and the United States. The government is in the hands of the Governor of the United States Naval Station at Pago-Pago. The islands are divided into three general administrative districts, corresponding to the former political divisions of Samoa, each administered by a native governor who is appointed by the governor of all the islands. At the head of each village is a chief, elected annually, subject to the Governor's approval. Governor at the beginning of the year, Capt. E. S. Kellogg, U.S.N.

**SAMOS.** An island in the Aegean Sea, belonging to Greece. Area, about 181 square miles; population, according to the census of 1920 and that of the refugees made in 1923, 84,204. Capital, Vathy, with a population of 12,472. The island was acquired from Turkey as a result of the Balkan War of 1912-13.

**SANDERSON, OSWALD.** British shipping man, died at Leeds, Eng., December 26. He was born in England in 1863, and from his earliest years was interested in shipping. For many years Mr. Sanderson was senior member of the firm of Sanderson & Son, steamship agents, of New York City, the company having been founded by his father. He left New York in 1900 to assume the position of managing director of

the Ellerman-Wilson Line, with its headquarters at Hull, England. He was a member of several boards of directors, including those of the Suez Canal Company, Lloyds Bank, Ltd., London, the North British and Mercantile Insurance Co., Earle Shipbuilding and Engineering Co., Ltd., and Wilson's and North Eastern Railway Shipping Co., Hull. He was also an enthusiastic yachtsman. He was honorary colonel of the East Yorkshire Regiment, and also of the Northumbrian Brigade of the Royal Field Artillery.

**SAN FRANCISCO, CALIFORNIA, ANNIVERSARY OF.** See CELEBRATIONS.

**SANGER, JOSEPH PRENTICE.** American soldier, died on March 15. He was born at Detroit, Mich., on May 4, 1840. He was a student at the University of Michigan from 1858-60. On May 1, 1861, he was commissioned Second Lieutenant in the First Michigan Infantry. He entered the regular army Aug. 5, 1861, and advanced through the different grades to the rank of brigadier general in July, 1902. During the Civil War he was twice breveted for gallantry. He was admitted to the bar in 1874, and was Director of the Census for Cuba, Porto Rico, and the Philippine Islands during 1899-1903. He served as a member of the Brownsville Court of Inquiry 1908-9, and in 1916 was appointed a member of the Medal of Honor board. In 1898-9 he was Brigadier General in the United States Volunteers. In 1904 he retired from active service in the regular army with the rank of Major-General.

**SÄNGERFESTS.** See MUSIC.

**SANITATION.** See GARBAGE AND REFUSE DISPOSAL; SEWERAGE AND SEWAGE TREATMENT; WATER-WORKS AND PURIFICATION.

**SAN MARINO, mã-ré'nó.** A republic of Europe, located in the peninsula of Italy. Area, 38 square miles; population, in June, 1920, 12,027. The chief exports are wine, cattle, and the building stone quarried on Mount Titano. The revenue and expenditure for 1924-25 balanced at 3,629,389 lire. There is no public debt. Politically and economically San Marino is closely allied with Italy.

**SANSKRIT.** See PHILOLOGY, MODERN.

**SANTO DOMINGO.** See DOMINICAN REPUBLIC.

**SÃO THOMÉ, soun tō-mă', AND PRINCIPE, prên-thē-pā.** Two islands in the Gulf of Guinea, about 125 miles from the coast of Africa, and belonging to Portugal. Area, 360 square miles; population, according to latest available statistics, 58,907 for São Thomé and 4938 for Principe. The islands are hilly, with volcanic soil, but the land is fertile and the products are varied. Cacao, cinchona, coffee, and rubber are the chief products. The revenue and expenditure for 1924-25 balanced at 8,274,692 escudos. Imports for 1924 were 38,894,176 escudos, and exports 96,720,981 escudos.

**SARAWAK, sh-rá'wák.** An independent state, comprising the northwestern part of the island of Borneo, under the protection of Great Britain. Area, about 42,000 square miles (coast line 400 miles). Population estimated at about 600,000, made up of Malays, Dyaks, Kayans, other Polynesian tribes, Chinese, etc. Kuching is the capital, with a population of about 25,000. There are large resources of coal, and recently an oil field has been opened up in the Baram region. The chief exports are benzine,

plantation rubber, and sago flour. The imports in 1924 were valued at £2,218,520; exports £3,976,622. The trade is chiefly with Singapore. The revenue in 1924 was £481,280; expenditure, £364,214. There is no public debt. The administration of the region was acquired by Sir James Brooke in 1842 from the Sultan of Brunei; it was governed by him under British protection. On his death in 1917 he was succeeded by his son, Sir Charles Vyner Brooke, who is the present rajah. British supervision is exercised by the British agent for Sarawak and British North Borneo.

**SASKATCHEWAN.** A Prairie Province of Canada, situated between Alberta on the west and Manitoba on the east, extending northward from Montana and North Dakota to the Northwest Territories. Area, 251,700 square miles; population, according to the census of 1920, 821,042, a gain of 63,532 over 1921. Capital, Regina, with a population in 1928, of 37,329. Other cities are: Saskatoon, 32,234, a gain of 25 per cent over 1921; Moosejaw, 19,200 in 1921; Prince Albert, 7550 in 1921. Of the total population in 1921, 538,552 were living in rural communities. In 1924 there were 197,209 pupils and 5948 teachers in the 4625 public elementary schools, and 16,014 pupils in the secondary schools. The total area under cultivation in 1924 was 26,622,582 acres, and the value of agricultural products was \$238,096,000. The acreage and estimated yield of the principal crops in 1925 was as follows: Wheat, 13,002,741 acres, 240,551,000 bushels; oats, 5,071,507 acres, 174,967,000 bushels; barley, 1,065,398 acres, 27,061,000 bushels; rye, 269,768 acres, 4,572,000 bushels; flax, 953,776 acres, 7,439,000 bushels; mixed grains, 30,077 acres, 902,000 bushels; other grains, 2500 acres, 48,000 bushels; potatoes, 45,000 acres, 3,623,000 cwt.; roots, 4876 acres, 417,000 cwt.; hay and clover, 380,500 acres, 635,000 tons; alfalfa, 5417 acres, 13,000 tons; fodder corn, 54,111 acres, 260,000 tons. Total exports in 1924-25 amounted to \$10,036,803; total imports \$9,866,108. In 1924 there were 6538 miles of steam railway in operation. The government is under a lieutenant-governor appointed by the governor-general of the Dominion of Canada, and a legislative assembly of 63 members elected for five years by universal suffrage. Women not only have the right to vote but are eligible for seats in the legislature. Lieutenant-governor, H. W. Newlands; premier, treasurer, and minister of railways, J. G. Gardiner; public works and telephones, A. P. McNab; education, S. J. Latta; agriculture and municipal affairs, C. M. Hamilton; attorney-general, J. A. Cross; highways, labor and industries, J. G. Gardiner; secretary and public health, J. M. Uhrich.

**SAULT STE. MARIE, CANALS AT.** In 1926 20,898 vessels passed through the United States and the Canadian Canals at Sault Ste. Marie, Michigan and Ontario, having a total registered tonnage of 71,290,862 tons as compared with 20,650 vessels of 69,239,520 tons in 1925. Through the United States Canal there were 17,548 vessel passages with a registered tonnage of 60,328,858, and through the Canadian Canal 3350 passages with a tonnage of 4,962,004. The total freight passing through the canals aggregated 85,679,087 short tons, of which 69,530,056 was east bound and 16,149,031 west bound. Iron ore to the amount of

57,549,699 tons, which was carried through the United States Canal, was the leading item of freight east bound, though 271,997,488 bushels of wheat and 100,269,792 bushels of other grain and 9,797,310 barrels of flour were included in the cargoes in this direction. West bound soft coal to the amount of 12,955,388 short tons and hard coal to the amount of 1,483,713 short tons were the leading cargoes, followed by merchandise of 620,607 tons, stone 543,653 tons, and oil 252,917 tons.

Before the canals closed for navigation there was the greatest ice blockade recorded in the history of Great Lakes navigation. This was only broken by the efforts of three powerful tugs and the car ferry, *Sainte Marie*, which released the shipping that had been held up above the lock. More than 100 east bound grain carriers were caught in this blockade and a number of the vessels had exhausted their fuel supplies and were held up until the milder weather intervened.

**SAVINGS BANKS.** See STATE BANKS; NATIONAL BANKS.

**SAXONY.** The name Saxony is applied to three divisions of the former German Empire; the Republic of Saxony (formerly the Kingdom of Saxony); the Grand Duchy of Saxony (now a part of Thuringia); and the Province of Saxony in Prussia.

**REPUBLIC OF SAXONY.** The third largest state of the German republic; proclaimed a republic on Nov. 9, 1918. Area, 5787 square miles; population, according to the census of 1925, 4,970,301. The capital, Dresden, had a population in 1925 of 608,025. The largest city is Leipzig, with a population of 660,140. The other cities with over 100,000 in 1925 were Chemnitz, 323,153, and Plauen, 109,953. In 1924 the movement of population was: Births, 86,662; deaths, 54,825; marriages, 36,376. The latest available school statistics showed 3547 common and continuation schools with a total attendance of 833,269 pupils. In proportion to its size, Saxony is the leading state in German industry, and rivals the chief industrial provinces of Prussia. In 1924 the area under cultivation was 2,319,590 acres. The area under the principal crops with their yields in metric tons was: Wheat, 174,375 acres, 188,100 tons; rye, 424,486 acres, 361,257 tons; barley, 70,444 acres, 66,600 tons; oats, 382,174 acres, 342,095 tons; potatoes, 253,368 acres, 1,760,931 tons; meadow, 453,630 acres, 729,376 tons of hay. The livestock census taken at the end of the same year showed 168,334 horses, 704,507 cattle, 621,399 pigs, 285,529 goats, and 102,681 sheep. The chief industry is textile manufacturing, but mining and metal-working are also of importance. In 1924, 3,817,000 tons of coal and 8,963,000 tons of lignite were produced, the combined value being 97,800,000 gold marks. The ordinary budget for 1925-26 balanced at £15,462,902 and the extraordinary budget at £926,628. The constitution of the republic is dated Oct. 26, 1920. The diet was elected on Nov. 5, 1924, and is composed of the following parties: Socialists, 41; Democrats, 8; German National Party, 19; German People's Party, 19; and Communists, 9. Prime Minister (appointed in February, 1924), Herr Heldt, of the Socialist Party.

**GRAND DUCHY OF SAXONY or SAXE-WEIMAR.** A former constituent state of the German Em-

pire; proclaimed a republic in November, 1918, but united at the end of that year with Thuringia (q.v.). Area, 1397 square miles; population in 1919, 433,959.

**SAXONY IN PRUSSIA.** A province of Prussia. Area, 9758 square miles; population in 1925, 3,281,293.

**SCABIES IN SHEEP AND CATTLE.** See VETERINARY MEDICINE.

**SCANDINAVIAN LITERATURE.** This review includes the late books of 1925 as well as those of 1926, and, as usual, is divided into Danish, Norwegian and Swedish literatures.

**DANISH. Poetry.** In *Limfjords Sange* (The Songs of Limfjord) Thøger Larsen shows great skill in handling old verse forms. The collection includes translations from Poe and Sappho. Johannes V. Jensen's *Aarets Højtider* (The Feasts of the Year) is written partly in verse and partly in prose. In spite of the author's self-concealment, the poems have a lyric quality. They remind us of Oehlenschläger. In *Elskovsgaver* (Love's Gifts), Tom Smith shows a strong desire for formal beauty; some of the poems have high technical perfection.

**Fiction.** In Alexander Svedstrup's *Erik Gudmand*, we see a small world which mirrors the larger one. Johannes Buchholtz wrote *Under det gyldne Træ* (Under the Golden Tree). In the earlier part of the book we miss the author's usual control over characters and situations. Olof Linck's *En Sommer blandt Sioux-indianerne* (A Summer among the Sioux Indians), shows a first-hand knowledge of the people portrayed. Einar Christiansen turned from his usual field, the drama. The theme of his novel *Ottilie* is the discrepancy between expectation and realization. Sven Lange's *De første Kampe* (The First Conflicts) gives a picture of modern historical situations. Some of the characters in the story are given fictitious names but are easily recognizable. Among collections of short stories are Chr. Engelstoft's *Halvtreds Aar* (Fifty Years) characterized by concentration and power; Christian Houmark's *Døgnets Barn* (Children of the Day), and Edith Rode's *Det Bittersøde Æble* (The Bitter Sweet Apple).

**Literary Criticism.** Hans Brix began a work, *Danmark's Digtere* (Denmark's Authors), two volumes of which have appeared. Brix is particularly interested in the personality back of the works.

**NORWEGIAN. Drama.** Oskar Braaten's *Den store barndøpen* (The Great Christening) is a play written on broad lines and in a popular vein. *Cæsar Borgia*, by Frederik Pærellius, although not in every way a perfect play for acting, yet contains scenes of great dramatic power.

**Poetry.** In the collection *Juoigem*, Carl Schøyen is highly successful in interpreting the soul life of the Laplanders. Nordahl Grieg's *Stene i strømmen* (Stones in the Stream) shows great lyrical power.

**Fiction.** Norwegian fiction shows a distinctly nationalistic tendency. In the matter of style, we note a preference for native expressions rather than Danish, and a movement away from the Latinity of earlier writings toward an everyday language, unrheterical and unembellished. Two Norwegian-American writers deserve mention. O. E. Rølvaag continued his story *I de Dage in Riket Grundlagges* (The Founding of the Kingdom). Like the earlier volume, so this

book received unstinted praise from Norwegian critics for its style, and from American critics for its faithful portrayal of earlier immigrant life. An English translation of both volumes will soon be published by Harper & Bros. Martha Ostenso's *Graaas* (Wild Geese) treats also of the life of Scandinavian settlers in America. One easily sees that Miss Ostenso is not a native of Norway; she is able to dissect Scandinavian sentiment with the accuracy and objectivity of the outsider. Kristian Elster's *Den Hellige Andreas* (Andreas the Saint) is a satire on the kind of idealism which fails to see the real side of practical problems. Axel Krogh's *Foged Karolius* (Governor Karolius) is an historical novel with strong, idyllic qualities. Among the collections of short stories are Johannes Thrap-Meyer's *Ektaser* (Extasies) and Johan Borgen's *Mot Mørket* (Toward Darkness).

*Science, etc.* Anathon Aal's *Psykologi* is the first Norwegian work dealing with the progress of psychological theory. Johan Landmark's *Fortolkninger til Sören Kierkegaards Ungdomshistorie* might be called in English "Sören Kierkegaard's Youth Interpreted."

*SWEDISH. Poetry.* In *Död och liv* (Death and Life), Karin Ek gives us her own soul experiences of a recent illness, sometimes in the key of the folk song, sometimes in that of the hymn. Another poet who sings from his heart is Ragnar Jändel. His *Heden och Havet* (Heath and Sea) has in it something naive and religious. With Frans G. Bengtsson, on the contrary, poetry is something external. His *Legender om Babel* (Legends about Babel) is interesting from the point of view of form. Bengtsson shows a marked ability to adapt his verse to any subject from any age and country. A good deal of Swedish poetry is written by Finlanders. Of particular interest is Bertel Gripenberg's *Den hemliga glöden* (The Secret Glow), published under a pseudonym and intended at first as a practical joke on the "modernistic" school, to which the poems belong. The extreme exponent of this school is Gunnar Björling, whose new book, *Korset och Löftet* (The Cross and the Promise) is obscure, filled with symbolism and religious mysticism. Jarl Hemmer, on the other hand, belongs to the old school. His *Skarseld* (Purgatory) is extremely subjective and indicates a conflict in the life of the poet.

*Fiction.* The average novelistic technique is probably better than before. Selma Lagerlöf has returned in her later books to the Värmland of *Gösta Berling*, to the mansions of the nobility, and to the cavaliers. In her latest book, *Charlotte Lövensköld*, there are worldly wisdom and irony, mixed with a certain legendary charm. Several miniature novels are brought into the story in concentrated form; these are all held together through the heroine, who dominates the whole. In *Hovmädlaren och Hans Hus* (The Court Painter and His Wife), Mila Hallman gave us an artist novel of the days of Charles XII. Written in a realistic vein, this story of marriage and divorce has a distinctly modern touch. Ernst Didring gave us a good novel of the old style in *Stormens år* (The Islands of Storm). Arvid Mörne, one of the Swedish writers in Finland, wrote *Ett Liv* (A Life), the story of a man who gets further and further away from the ideals of his conservative home and becomes a leader of the

radicals. His work ends in failure, no doubt because he is at bottom egocentric. By its background the story gives us an excerpt of Finnish history. F. U. Wrangel's *Minnen från Konstärkreterna och Författarvärlden* (Recollections from the Artist Circles and the World of Authors) tells of the writer's art studies in Düsseldorf, Paris, and Venice. Of special interest is the author's acquaintance with Strindberg. Among collections of short stories are Sigfrid Siwertz's *Vattenvärlden* (The World of the Sea); Carl Larsson's *By's Lantliga Historier* (Land Stories); and Harald Wägner's *Tåg* n:r 278 (Train No. 278).

*Literature, Memoirs, etc.* The year was rich in memoirs. Esther Jacobson's *Gustav III:s moder* (The Mother of Gustav III), written in an entertaining vein, affords a good insight into the political and social conditions of Sweden during the Age of Liberty. Fröding scholars find Mauritz Hellberg's *Frödingsminnen* (Recollections from the Life of Fröding) valuable. In Arne Lidén's *Den Norska Strömmingen i Svensk Litteratur under 1800-Talet* (Norwegian Influences in Swedish Literature during the Nineteenth Century), the chapter on Strindberg is the best. See PHILOLOGY, MODERN.

**SCARLET FEVER.** R. Bieling, who is director of a serum-manufacturing institute in Germany, discussed the Dick toxin in the *Münchener Medizinische Wochenschrift* for September 3. Even in strong dilution, this will produce the characteristic skin reaction in those sensitive to scarlet fever as well as in actual patients up to the time of convalescence. During convalescence the reaction is absent. If the blood serum of scarlet fever immunes is mixed with the toxin, the latter is neutralized. This much works out perfectly for mankind, but when the author made tests on pigs and sheep the results were negative, although from analogy this should not be the case. Clinically, there can be no doubt of the efficacy of the anti-toxin in toxic scarlet fever, but it is puzzling to find that while the vast majority of convalescents become permanently immune, about 20 per cent retain their sensitiveness to the toxin. This makes us think that there must be another factor besides the anti-body which contributes to immunity. Still more puzzling is the fact that a Dick toxin can be produced by the cultivation of streptococci which have nothing to do with causing scarlet fever, while individuals infected with streptococci of different pathogenic properties yield a toxin which produces the Dick skin reaction. On the other hand, streptococci of scarlet fever may fail to yield a Dick toxin.

These Dick toxins of foreign source are also neutralized by the blood serum of convalescents from scarlet fever. Non-scarletinous streptococci which can produce these Dick toxins have been obtained from the blood of patients with erysipelas, meningitis, lipoid nephrosis, and puerperal sepsis. In other words, scarlet fever immunity and Dick toxin insusceptibility do not run strictly parallel. It may, therefore, be premature to proceed on too large a scale with the immunization of children with the Dick toxin-antitoxin. There are, very likely, streptococci in the blood of scarlet fever patients which are not specific but accidental invaders; so that the toxin produced will be of a mixed nature and not specific. We do not yet know whether

a scarlet fever immune can be infected with some of these other pathogenic streptococci.

Stevens and Dochez report, in the *Journal of the American Medical Association* for April 10, cases of so-called "scarlet fever without rash" in which the chief symptom is sore throat. Some of these patients give a negative Dick test which should indicate immunity from scarlet fever, yet the causal organism appears to be the hemolytic streptococcus of scarlet fever. In other words, the same organism appears to produce separate diseases, and is thought to be able to set up primary nephritis and endocarditis.

**SCHIRMER, FRIEDRICH.** A German violoncellist and conductor, died in St. Louis, January 29. He was born at Bonn, Germany, Oct. 27, 1881. After studying at the conservatories of Cologne and Leipzig, he completed his musical education under Humperdinck, at the Meister-schule in Berlin, and then went to Königsberg as conductor. Having collaborated with Humperdinck and Vollmöller on the musical score of *The Miracle*, he was engaged by Max Reinhardt as conductor for productions in London, Paris, Vienna, Prague and the United States. He wrote also a Symphony in B $\flat$  minor, two symphonic poems, a suite and an overture, besides several choral works with orchestra.

**SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**SCHULTZ-ADAEVSKY, ELLA VON.** Russian pianist and composer, died in Bonn, August 29. She was born in Petrograd, Feb. 10, 1846. After some years of study under Henselt she made her début in 1862, and made successful tours for the next four years. She then entered the Petrograd Conservatory, continuing her studies under Dreychock and Rubinstein (piano) and Famintsyn and Zarembo (composition), specializing in Greek music. From 1882-1909 she lived in Venice, after which time she resided at Neuwied, near Bonn. Her compositions include chamber-music, a capella choruses and pieces for piano. An opera, *The Dawn of Liberty*, was produced in Petrograd in 1891. During her residence in Italy she made an extensive collection of Italian folk-songs.

**SCHUYLER, LOUISA LEE.** American philanthropist, died at Highland Falls, N. Y., October 10. She was born in 1837, of a family of fortune, a great grand-daughter of Gen. Philip Schuyler and Alexander Hamilton. At the outbreak of the Civil War she joined the United States Sanitary Commission, the precursor of the Red Cross. She served as Chairman of the Committee on Organization and Publicity of the New York branch of this Commission during the four years of the war. On May 11, 1872, Miss Schuyler founded, in the home of her parents, the New York State Charities Aid Association which soon became a most useful agency for philanthropic work. In these early days she gathered around her in association with the work such men as Prof. Theodore W. Dwight, Howard Potter, Theodore Roosevelt (father of the President), and William E. Dodge. Miss Schuyler in 1874 founded the first training school for nurses, in connection with Bellevue Hospital. In 1907 Miss Schuyler was appointed one of the original trustees of the Russell Sage Foundation, and in 1915 Columbia University conferred upon her the degree of

Doctor of Laws; the second time in the history of the university that this degree had been given to a woman. In 1923 she received one of the three gold medals of the Roosevelt Memorial Association. In 1908 she organized the first American committee of physicians and laymen to investigate the causes of blindness. Later she established the National Committee for the Prevention of Blindness.

**SCHUYLERSVILLE, N. Y.** See CELEBRATIONS.

**SCHWAN, THEODORE.** American soldier, died at New York, May 27. He was born July 9, 1841, in Germany, and entered the United States regular army in 1857. For distinguished gallantry in action at Peebles Farm, Virginia, Oct. 1, 1864, he was awarded the Medal of Honor. In 1892-93 he was attached to the American embassy in Berlin, and during this period he prepared a report on the organization of the German army and its general staff. This was submitted to the authorities in the United States and was for a long time the standard work on military organization. In 1901 Major General Schwan was retired from the army on his own request, after 44 years' service.

**SCHWARZ, JOSEPH.** An eminent Russian dramatic baritone, died in Berlin, November 10. He was born at Riga, Russia, in 1880. He became an excellent pianist, and in 1901 he began his vocal studies under Heinemann in Berlin. After further training under Rubinsohn, in Vienna, he made his début as Amonasro in *Aida* at Linz, 1904. Then he sang at Graz and Riga, where Mahler heard him and secured him at once for the Vienna Hof-oper (1910). There he remained six years, and then became a member of the Staats-oper in Berlin. His American début, in concert, New York, Jan. 3, 1921, created almost a sensation, and he was immediately engaged by the Chicago Opera Company, where he made his first appearance as Rigoletto Nov. 21, 1921.

**SCOTT, WILLIAM R.** President of the Southern Pacific Lines in Texas and Louisiana, died at Los Angeles, Calif., on December 20. He was born at Houston, Tex., in 1860, and from the age of 21 devoted himself to railroad work. He began as a fireman on the Texas and Santa Fé Railroad and rose steadily through various positions until in 1903 he joined the Southern Pacific Railway as assistant superintendent of the Sacramento division. In 1912 he was elected to the vice-presidency of the system. During the World War he was Federal manager of part of the Southern Pacific system, and in 1920 he became president of the Southern Pacific lines in Texas and Louisiana, which position he held up to his death.

**SCRIPPS, EDWARD WYLLIS.** American newspaper man, died March 12. He was born at Rushville, Ill., June 18, 1854, and received his education in the public schools and from private tutors. His first step in the newspaper business was taken in Detroit, Mich., in 1874, and he gradually acquired a controlling interest in 28 daily newspapers in 15 States. He became the presiding genius of the Scripps-Howard news-

papers, including the Scripps-McRae League of Cincinnati. He was also the controlling owner of the United Press Association of New York City, and controlling director of the Newspaper Enterprise Association, Cleveland, Ohio. Among the newspapers controlled by Mr. Scripps were the *Cleveland Press*, of which he was founder and first editor, the *Cincinnati Post*, the *Toledo News-Bee*, the *Columbus Citizen* and the *Pittsburgh Press*.

**SEISMOLOGY.** The word "earthquake" has in modern times acquired a two-fold meaning—it still denotes a shaking of the solid earth which can be felt and may cause damage, and it is also used for any of those small tremors that cannot be felt but which can be registered by delicate seismometric instruments; seismology has come to be, to an ever-increasing extent, the study of the latter. The unfelt disturbances first attracted attention because in some cases they were obviously connected with very distant quakes of destructive violence. It was soon found, however, that those which could be directly connected with distant quakes were far outnumbered by those that could not be so connected; it has been generally assumed that the latter are manifestations of violent quakes that occur under the sea or in uninhabited regions, but Oldham maintains that with few exceptions the two types of tremors are of quite different origins. The foci of quakes that are felt usually lie at small depths in the earth's crust—ordinarily much less than 10 kilometers—while the distant, unfelt quakes seem to originate at depths well over 100 kilometers; Oldham regards the shallow, destructive shocks (episcisms), when they occur, as secondary effects of the deep-seated disturbances (bathyseisms), the former being due to the resultant fracturing of crustal rocks nearly simultaneously with the deep-seated shock.

The interpretation of the records made by self-registering seismographs requires the aid of mathematical investigation of the propagation of different types of elastic waves through media such as the body and the rocky crust of the earth. Several such studies have recently been carried out by Jeffreys, Stoneley, Visser, Kunitomi, Matuzawa, and others. The known facts about the mean density and the tidal yielding of the earth, together with the results of deciphering seismometric records, provide means whereby, with the aid of laboratory experiments (such as those of L. H. Adams and others at the geophysical laboratory of the Carnegie Institution) on rocks, under conditions of temperature and pressure simulating those within the earth, the nature and structure of the interior of the earth may be determined. It is now quite certain that the earth is composed of a metallic core, surrounded by a thick shell of peridotitic (ultra-basic) rocks (such as compose meteorites) and a thinner shell of granitic (acidic) rocks, together with a surface film of sedimentary rocks and soil. It is generally supposed that the earth is solid and rigid through-

out, although Jeffreys has recently brought forth evidence to show that the core may have little rigidity, and, perhaps, is even fluid.

New seismological tables for the determination of epicentral distance and depth of focus have recently been issued by Mohorovičić, and by Byerly and Mitchell.

**SELANGOR.** See article, FEDERATED MALAY STATES.

**SENEGAL**, sèn'égál'. A colony belonging to France on the west coast of Africa, under the government of French West Africa (q.v.). Total area, 74,112 square miles; population in 1921, estimated at 1,225,523, of whom 4321 were Europeans. Capital, St. Louis, with a population in 1917 of 23,326. Other important towns are: Dakar, the seat of the government-general of West Africa, and a fortified naval station; population, 1918, 25,468, of whom 2791 were French; and Rufisque, population, 11,414. These three towns, and also Goree, a small island near Dakar, are municipal communes governed by mayors and corporations.

The estimated area under cultivation has been placed at 307,000 acres. Cotton is cultivated, and a wild variety is also found. The principal source of wealth consists of peanuts, and the value of the export of this commodity is three times that of all other exports taken together. Gum, corn, palm products, rice, sesame, shea butter, and millet are produced, the last-named being, from the native standpoint, the most important cereal. Two kinds are grown; the larger millet is cultivated extensively in the river valleys and the small millet on drier ground. In 1924 the imports were valued at 477,871,418 francs and the exports at 386,098,032 francs. The local budget for 1924 was 30,559,261 francs. Dakar, Rufisque, and St. Louis are connected by a railway 165 miles in length, and during the year another stretch was nearly completed between Thiès and Kayes, a distance of 435 miles. The administration is in the hands of a lieutenant-governor, assisted by a council of 40 members, 20 of whom are elected by the French citizens and 20 by representatives of the native chiefs. The colony sends one deputy to the French parliament.

**SERBIA.** A former Balkan kingdom which was proclaimed in December, 1918, a part of the new Unitary State of the Serbs, Croats, and Slovenes. See JUGO-SLAVIA. It is bounded on the east by Bulgaria, on the west by Albania and Montenegro, on the south by Greece, and on the north is separated from Hungary by the Danube and Save Rivers. In the new state Serbia is divided into two provinces, North Serbia, with an area of 19,286 square miles and a population, at the census of 1921, of 2,655,078, and South Serbia, with an area of 17,651 and a population of 1,474,560. The former capital of Serbia, Belgrade, became the capital of Jugo-Slavia, and had a population in 1921 of 111,740.

**SESQUI-CENTENNIAL AT PHILADELPHIA.** See EXPOSITIONS.

**SEVENTH DAY ADVENTISTS.** See ADVENTISTS.

**SEWERAGE AND SEWAGE TREATMENT.** Outstanding among new projects was a system of intercepting or trunk collecting sewers and a mammoth pumping station and sewage-treatment plant for the city of *Detroit, Mich.*, general plans for which were approved by the city council late in the year. The intercepting sewers were designed to divert the sewage from many outlets along the waterfront to the pumping station and sewage-treatment plant on the Rouge River below Detroit. The pumping station and sewage works, as outlined in a special report by consulting engineers, would have a capacity sufficient to treat the sewage from a population of 2,400,000, but the intercepting sewers would be large enough to bring to these works the sewage from a population of 3,500,000. On arriving at the treatment plant the sewage would first pass through bar screens and then through a "skimming-detritus" tank plant. Here the light floating matter, chiefly grease, would be removed from the top of the tank while the heavier matter in suspension, mostly mineral and non-putrescible, would gradually fall to the bottom of the tank for removal and disposal separately from the settleable solids of a putrefactive character. The latter would be retained and reduced in volume by two-story (Imhoff) tanks. The clarified effluent from the Imhoff tank would be subjected to chlorination for disinfecting purposes. The residue or sludge in the lower compartment of the Imhoff tank would go to sludge-drying beds. The estimated cost of the intercepting sewers was \$15,600,000; pumping station, \$2,250,000; sewage works, \$18,150,000. These three sums, with 10 per cent for engineering contingencies, made up a total of nearly \$40,000,000. The project also included a large mileage of sewer extensions in various parts of the city, at a total estimated cost of some \$60,000,000; making the entire programme come to over \$100,000,000. This proposal is to be carried out during the next seven years. The *Chicago Sanitary District* is continuing its programme of building sewage works to lessen the volume of organic matter discharged through the drainage canal into the Mississippi River system. (See earlier YEAR BOOKS.)

*Cleveland* was building its third sewage-treatment plant. This, with the two already put in operation, will complete the programme entered upon some years ago. The two earlier plants are on the lake front. The new plant is on the Cuyahoga River, and on account of a less amount of diluting water will consist of not only two-story (Imhoff) settling tanks, but also sprinkling filters. *New York City* was continuing its policy of putting in sewage works for sections of the city so located as to suffer most from the discharge of untreated sewage into tidal water. Partial treatment only is considered sufficient for the time, and for this purpose fine screens are being used. A plant of this type, having a capacity of 80,000,000 gallons per day, was put in operation near the end of the year, to serve a portion of the Jamaica section of the city, on Long Island. A number of smaller fine-screening plants are already in operation. Passing to the Pacific front of the Continent, where the city of *Los Angeles* had already installed large fine-

screening plants, sanitation districts comprising a large area within Los Angeles County, but outside the city, were being formed in accordance with a general statute, and a number of these had united in a joint intercepting-sewer scheme. Toward the end of the year the State Board of Health of California, which, like the boards in many other states, must approve sewage-disposal schemes before they are put under construction, passed tentatively upon a project for what was known as the *Los Angeles County Sanitation Districts*. The proposed intercepting sewer would have sufficient capacity to serve 1,800,000 persons. Fine screening is proposed before the sewage from these districts is discharged into the Pacific Ocean.

A new book in this field is Fuller and McClintock's, *Solving Sewage Problems* (New York), and a revised edition of an English book is Kershaw's *Sewage Purification and Disposal* (Cambridge, England, and New York).

**SEXUAL SELECTION.** See ZOOLOGY.

**SHANTUNG**, shān'tōng'. One of the eighteen provinces of China proper; in dispute between China and Japan after the Treaty of Versailles; returned to China by Japan in accordance with the agreement reached at the Washington Conference of 1921-22. Area, 55,970 square miles; population, estimated at 25,810,000.

**SHEEP.** See LIVESTOCK.

**SHERMAN**, STUART PRATT. Literary editor of the *New York Herald-Tribune*, and critic, died on Lake Michigan, near Manistee, Mich., August 21. He was born Oct. 1, 1881, at Anita, Ia., and in his childhood traveled widely in the various states with his parents. He was graduated from Williams College in 1903, and one year later he obtained the A.M. degree from Harvard. It was while he was working for this degree that he wrote his famous letter to *The Nation* attacking the classical method of teaching English, as employed by Prof. George Lyman Kittredge. He went to Northwestern University as instructor in English, and followed his successes there in a similar position at the University of Illinois. His rise to a full professorship was remarkably fast; in 1911 he became head of the Department of English. His teaching appointments took up 18 years of his life, but meanwhile he was busy writing. With Prof. William P. Trent, Carl van Doren and John Erskine as associates he finished, in 1917, *The Cambridge History of American Literature*. Soon after he published his first independent book, *Matthew Arnold*, and from this time on he gave himself to the writing of critical articles. He was unable, however, to follow this line of work exclusively, and before long his volume, *On Contemporary Literature*, stirred critics and students alike. His critical articles were collected into books, and his next work, *Americans*, was a collection of essays which had appeared in *The Atlantic Monthly*, *The Nation*, and *The Yale Review*. He also wrote *Genius of America*, and *Critical Woodcuts*. In 1923 Mr. Sherman was elected to membership in the American Academy of Arts and Letters; he had long been a member of the National Institute of Arts and Letters. In 1924 he became literary editor of the *New York Herald-Tribune*.

**SHERRY**, LOUIS. American caterer and restaurateur, died in New York, June 9. He

was born at St. Albans, Vt., in 1855. He first went to Montreal, but shortly removed to New York. He worked as a waiter, and was still a young man when he was asked by the management of the Hotel Elberon, at Elberon, N. J., to take charge of the dining room and the kitchen of that establishment. With several hundred dollars which represented his profits of the season, Sherry returned to New York and opened a catering business at 38th Street and 6th Avenue. When this establishment became prosperous he went to Paris in search of new ideas for his business. On his return he moved to Fifth Avenue and his activities developed rapidly. In 1919 Sherry declared that Prohibition had made his business impossible, and he closed his doors, but later he opened two new restaurants.

**SHERWELL, GUILLERMO ANTONIO.** American educator and secretary of the Inter-American High Commission, died July 7, at Washington, D. C. He was born at Paraje Nuevo, Vera Cruz, Mexico, June 5, 1878, of American parents, and studied at the National University of Mexico and at Georgetown University. For one year he taught psychology and the science of education at the Normal School in Jalapa, Mexico, and then became professor of history and Spanish literature in the College of Jalapa, a position which he held from 1903 to 1912, when he became dean of the college. In 1913 he was made head of the grammar schools, normal schools and vocational school system of Mexico City. He later served as counselor to the Mexican National University and was put in charge of the department of public instruction and fine arts of Mexico. In 1915 he went to New York, and spent some time as a teacher of Spanish in the high schools of that city. In 1918 he was appointed juristic expert of the Inter-American High Commission, in Washington, D. C., and in the same year became professor of Spanish and foreign laws in Georgetown University. Dr. Sherwell served as secretary of the Dominican group committee of the first Pan-American financial conference, and as technical attaché of the International High Commission for the plenary meeting in 1918.

**SHIPBUILDING.** According to the annual summary of the mercantile shipbuilding of the world for the year 1926 prepared by Lloyd's Register, the total output for the year was 1,674,977 tons, a decrease of 518,427 tons from 1925, and of 1,057,605 tons from 1913 when the pre-war world's record output amounting to 3,332,882 tons was reached. This summary of Lloyd's Register, it should be remembered, does not include warships and takes into account only merchant vessels of 100 tons gross and upwards that were launched in 1926, whether they were completed during the year or were under construction December 31st.

In 1926 there were launched throughout the world 28 vessels of over 300,000 tons fitted with steam turbines, all of which with three exceptions were equipped with reduction gearing. The average tonnage of these vessels exceeded 10,760 tons. Internal combustion engines were fitted to ships of 704,006 tons launched during 1926 as compared with 843,629 tons launched in 1925, but the 1926 proportion was 76 per cent of the world's output of steam tonnage as compared with about 65 per cent in 1925. At the end of 1926, however, the tonnage of motor ships being

built in the world amounted to 90 per cent of the steam tonnage under construction.

**GREAT BRITAIN.** The output of shipping from Great Britain and Ireland in 1926, namely, 639,568 tons and 38.2 per cent of the world's total, was 445,065 tons or 11 per cent lower than in the previous year. The 1926 production included 142 steamers of 431,833 tons, 37 motor ships of 201,913 tons, and 18 barges of 5822 tons, all built of steel. Of the tonnage launched during the year 89,908 tons, or 14 per cent, was for owners residing abroad, while the remainder was for registration in Great Britain and Ireland. There were 44 vessels of between 5000 and 10,000 tons each, and 12 vessels of 10,000 tons and over. The largest were the motor ships *Alcantara*, 22,150 tons, and *Carnarvon Castle*, 20,063 tons; and four turbine steamers, *Almeda*, *Andalusia*, *Avelona*, and *Avila*, of about 14,000 tons each. Excluding vessels of less than 1000 tons, 19 tankers of 100,020 tons were launched during 1926. Steam turbines were to be used on 13 British vessels with a total tonnage of 119,308 tons launched in 1926, all of which were to have geared turbines, and of the 12 vessels of 10,000 tons and upwards launched during the year 8 were to be fitted with turbines. During 1926 British and Irish yards launched 37 motor ships of 201,913 tons representing over 46.75 per cent of the steam tonnage launched.

**Output by Ports.** The Clyde district with a production of 267,645 tons was first among British shipbuilding centres, followed by the Tyne with 126,609 tons, Belfast with 92,219 tons, the Tees with 37,183 tons, the Wear with 35,187 tons, and the Mersey with 34,619 tons. The Clyde showed a large decrease, its output being 239,072 tons lower than in 1925, and decreases were scored for the other ports except Belfast where there was an increase of 34,173 tons, and the Mersey where the gain was 12,940 tons.

**ITALY.** Italy in 1926 launched 220,021 tons or 77,975 tons more than in 1925, and the greatest output ever recorded for the country and the first time that it exceeded all countries except Great Britain. In the Trieste district 14 vessels of 94,136 tons were launched as compared with the output of 110,006 tons during 1925, but in this number were included a motor ship of 33,000 tons, the *Augustus*, a turbine steamer of 32,583 tons, the *Roma*, launched at Sestri Ponente, near Genoa, and a motor ship, the *Vulcania* of 23,700 tons, launched at Monfalcone, near Trieste. Eleven vessels of between 6000 and 10,000 tons each were launched during the year, and one of just over 10,000 tons. Seventeen motor ships of 153,121 tons were launched and 3 turbine engine vessels of 48,233 tons.

**GERMANY.** Germany was third in the nations of the world for tonnage launched, with 60 vessels of 180,548 tons, or a decrease of 225,826 tons from 1925, when Germany had a production of 37 per cent of the world's shipping outside of Great Britain. The 1926 output, however, included three vessels to be fitted with geared steam turbines, one, the turbine steamer *New York*, of 21,200 tons, and two of 7288 tons. There were 22 vessels of 70,478 tons, to be fitted with oil engines, 5 tankers of 44,792 tons, and the *Padua*, a steel four-masted barque of 3064 tons.

**UNITED STATES.** Lloyd's Register reported for the United States on their basis of registry an

output of 150,613 tons which was 21,837 tons more than in 1925, but, of course, far under the record year 1919 when 3,579,826 tons were launched. Of the tonnage launched 37 steamers and motor ships of 81,350 tons, and 27 barges of 25,954 tons were built on the Atlantic Coast, 5 steamers of 35,396 tons on the Great Lakes, and 9 vessels of 7913 tons on the Pacific Coast. The largest vessels launched during the year were the turbine steamer *Malolo*, of 17,200 tons, built at Philadelphia; 6 vessels of between 5000 and 9000 tons were launched on the Atlantic Coast; and 2 vessels of about 8000 tons launched on the Great Lakes. The output of the United States is discussed further on in more detail.

**FRANCE.** The output of shipping for 1926 in France was 121,342 tons, or 45,773 tons more than in 1925. France launched the largest vessel of the year in the world, namely, the turbine steamer *Ile de France* of 43,500 tons, built at Saint Nazaire. There were also two motor ships and one turbine steamer of between 8000 and 9000 tons each, and one steam tanker of 11,500 tons. Five vessels of about 70,000 tons launched in France during the year were fitted for burning oil fuel.

**HOLLAND.** Holland's total tonnage launched in 1926 was 93,671 tons or 14,848 tons higher than in the previous year, excluding the vessels exclusively intended for river navigation, of which as usual there was a considerable output. There was one steamer of 8700 tons and 6 motor ships of about 7100 tons each. Vessels fitted with oil engines launched during the year totaled 25 of 55,170 tons; 6 of these, of 43,212 tons, and 2 steamers, of 5203 tons, were tankers.

**SCANDINAVIAN COUNTRIES.** There was a reduction of tonnage in Denmark, Norway and Sweden in 1926 from 1925, the output for the three countries amounting to 134,863 tons. The decrease was due almost entirely to the decline of 19,568 tons in the output from Norwegian yards. There were 9 motor ships of between 4000 and 7500 tons launched in Denmark and 9 in Sweden of similar dimensions. Internal combustion engines were fitted to a total tonnage of 115,958 tons, of which 63,537 tons were in Denmark, 51,660 tons in Sweden, and 761 tons in Norway.

**JAPAN.** In 1926 the Japanese output—52,405 tons—was 3379 tons less than in 1925, and comprised 4 vessels of between 5400 and 7300 tons each, one of which was fitted with steam turbines and was of 5484 tons, while three were to be fitted with oil engines.

**BRITISH DOMINIONS.** The British dominions overseas in 1926 launched 12,400 tons less than in 1925, the total output being 33,678 tons. Of this amount 25,284 tons were launched in Canada, including 10,836 tons on the Great Lakes. There were 5 steamers, of between 2300 and 2500 tons each, and one of 10,480 tons, the *Glenmohr*, which was launched at Toronto.

**AMERICAN SHIPBUILDING INDUSTRY.** The shipbuilding industry in the United States in 1926 showed a substantial gain over the previous year. According to the annual summary of *Marine Engineering and Shipping Age* (New York) American shipyards delivered 494 merchant vessels of 225,704 gross tons in 1926 and had under construction 272 merchant vessels of 272,161 gross tons, or an output 19 per cent greater than in 1925 and 56 per cent greater than in 1924. The orders in hand at the end of the year represented 63 per cent more tonnage

than in December, 1925, and 122 per cent more than at the end of 1924. In 1926, 41 American yards were building merchant vessels, as compared with 49 in 1925 and 33 in 1924. At the end of the year 37 yards had orders for new work, as against 33 in 1925 and 27 in 1924. Of the tonnage built in 1926, 51 per cent was built on the Atlantic and Gulf Coasts, 34 per cent on Western rivers, 13 per cent on the Great Lakes, and 2 per cent on the Pacific Coast. Of the vessels built, 30 per cent of the tonnage was steam driven, 15 per cent motor ships, and 55 per cent barges or non-self-propelled craft.

United States naval vessels were under construction at the Fore River plant of the Bethlehem Shipbuilding Corporation and at the American Brown-Boveri Electric Corporation, Camden, N. J., where the airplane carriers *Lexington* and *Saratoga* were being built. The Cramp yard in Philadelphia was building the 10,000-ton cruiser *Salt Lake City*.

The Commissioner of Navigation, in his report for 1926, included the accompanying table of vessels built during the fiscal years 1925 and 1926.

**SHIPPING.** On June 30, 1926, the gross tonnage of seagoing and iron steamers and motor ships comprising the merchant fleets of the world, disregarding sailing vessels and wooden steamers, was 59,117,000 tons, which was a gain of 331,000 tons over 1925 and an increase of more than 16,500,000 tons, or 39 per cent from the tonnage on June 30, 1914, just previous to the World War. In 1926 the tonnage of tankers, which in 1914 totaled 1,479,000 tons, had increased to 5,665,000 tons, and that of motor ships to 3,500,000 tons, from the small total of 234,000 tons in 1914. By 1926 more than 18,250,000 tons of merchant steamers were equipped for oil fuel, as compared with 1,310,000 tons in 1914. Figures for world shipping in 1926 from *Lloyd's Register* are given in the accompanying table.

At the end of June, 1926, there were more than 6,000,000 tons gross of idle shipping not in use, including nearly 4,000,000 tons of United States vessels and 1,360,000 tons of British vessels laid up in Great Britain and Ireland. There was, however, an improvement during the latter half

\* Returns are not available as regards Germany and Austria-Hungary for the war period (1914-18) nor as regards Germany for 1919 and 1920.

of the year, so that by December 31 the world's idle shipping had declined to about 4,076,000 gross tons, the more important reductions in the concluding six months of the year being those in the United States and in the United Kingdom, 881,000 and 744,000 tons, respectively.

In the United States, in the year ended June 30, 1926, there was a decline in merchant shipping amounting to 565,000 tons, or 5 per cent, which did not, however, reflect less tonnage active under the American flag, but rather a decrease of idle shipping by about 250,000 gross tons. On the other hand, there were substantial increases in shipping in the following countries: Italy, 231,000 tons, or 8 per cent; Norway, 194,000 tons, or 7 per cent; and the British dominions, 94,000 tons, or 4 per cent. Other countries did not show substantial changes. The accompanying table from *Commerce Reports* shows the tonnage of shipping owned in the maritime countries of the world on June 30, 1926, and in 1914.

[In thousand gross tons]		
Country		
Great Britain and Ireland	1914	1926
British Dominions	1,407	2,324
United States	1,887	11,040

[In thousand gross tons]		
Country		
France	1,918	3,303
Germany	5,098	3,049
Holland	1,471	2,552
Italy	1,428	3,125
Japan	1,642	3,806
Norway	1,923	2,749
Other countries	6,913	7,931
Total	42,514	59,116

During 1926 oversea trade in the world's merchant marine increased, but that of Europe had not grown to the same extent as that of other parts of the world. The British coal strike, however, provided temporary employment for many idle ships, and caused freights—particularly those of bulk cargoes, which had declined in the first and second quarters of 1926—to rise rapidly and to be maintained at a high level during the third and fourth quarters of the year. Shipment of coal from the United States to the United Kingdom began during the latter part of May, and from that time until the end of November aggregated nearly 9,200,000 tons. Charter rates ranged from \$2.90 at the close of May to about \$10 in October.

UNITED STATES. The Commissioner of Navigation, in his *Annual Report* for the fiscal year 1925-26, stated that on June 30, 1926, the merchant marine of the United States included all kinds of documented vessels, and comprised 26,343 of 17,311,147 gross tons, of which 3052 seagoing vessels of 11,895,058 gross tons were 1000 tons or over, as compared with 26,323 of 17,399,376 gross tons on June 30, 1925. The ownership of seagoing tonnage on July 1, 1926, was as follows: Private ownership, 500 tons and over, 1311 steel ships of 5,899,753 gross tons, and 685 wooden ships of 832,971 gross tons, or a total of 1996 vessels of 6,732,724 gross tons. The United States Shipping Board, on July 1, owned 1054 steel vessels of 1000 gross tons and over, or a total of 5,157,889 tons, and 2 wooden vessels of 4445 gross tons, or a total of 1056 of a gross tonnage of 5,162,234. This total compared with that of July 1, 1925, when there were 1218 ships of 5,839,659 gross tons. The decrease of 162 vessels of 677,325 gross tons owned by the Shipping Board was explained as follows: Lost, 1, of 5588 gross tons; sold to aliens, 6, of 26,603 tons; sold to citizens, 127, of 547,832 tons; scrapped, 28, of 91,584 tons; and reduced by readmeasurement or rebuilding, tonnage to the amount of 5658 gross tons.

On June 30, 1926, 3052 vessels of the United States merchant marine of 500 tons and over were engaged in the foreign and coasting trades, as indicated in the table at the bottom of the page.

The following table shows the geographical distribution, motive power, and material of construction of the American merchant fleet for the fiscal years 1925 and 1926.

The United States Shipping Board, in its annual report for the fiscal year ended June 30, 1926, stated that the Government-owned merchant fleet had been reduced during that period by a total of 350 ships, representing 1,671,390 dead-weight tons, through sales to private interests, both for operation and for scrapping. At the end of the fiscal year the total government-owned fleet amounted to 881 vessels of 6,876,069 tons in the aggregate. The Shipping Board had undertaken to form from the war-time fleet a nucleus around which an American merchant marine could be established and ultimately owned privately. Numerous trade routes, both passenger and cargo, had been established, and these routes were turned into private hands for guaranteed operation over a specified period of years, as far as purchasers for these services could be developed. During the fiscal year the Shipping Board sold two passenger lines which it had established and operated, the Pan American Line and the American Oriental Mail Line. These, with the operation of the United States Lines, running between New York and Great Britain and Europe, and the combination cargo and passenger service of the American Merchant Line from New York to London, completed the disposal of all passenger services of the Shipping Board. There were sold 40 steamers of the

NOTE.—A considerable number of vessels which were not completed appear in this table. Steamers of less than 100 tons gross and sailing vessels of less than 100 tons net are not included. Vessels trading on the Caspian Sea and wood or composite vessels trading on the Great Lakes of North America are not included. In the absence of satisfactory information, the records of most of the sailing vessels belonging to Greece, Turkey, and Southern Russia are omitted from this table. Japanese sailing vessels are not recorded in Lloyd's Register and therefore do not appear in this table. Under the heading "Country not stated" are included all vessels entered in Lloyd's Register without record of flag and under "Other countries" are those vessels about which no definite information has been received up to the time the Register book went to press.

type built on the Great Lakes during the War, for use in coastwise trade, due in large measure to the industrial development in the Southern States. There were sold also 15 ships of the 5000-ton class and 20 ships ranging in size from 7500 to 12,000 tons each, for service in domestic waters. There were 199 vessels, totaling 813,820 dead-weight tons, without market value as commercial carriers, which were sold to the Ford Motor Co. for scrapping.

During 1926 the United States Shipping Board sold 91 cargo ships, aggregating 621,093 dead-weight tons, and 5 passenger vessels, aggregating 70,730 gross tons. The Board also sold five drydocks for a total of \$420,000. The passenger-cargo ships of the American Oriental Mail Line, running between Seattle and the Orient, were sold to the Admiral Oriental Line of Seattle for the sum of \$4,500,000. The America-South Africa Line, with 5 vessels of 42,978 dead-weight tons, was sold to the America-South Africa Line, Inc., for \$777,901. The Pacific, Argentina and Brazil Line, with 6 vessels, aggregating 51,403 dead-weight tons, was sold to a new corporation of this name, for \$295,515. The Board also sold 12 tankers, of which 5 were to be converted to Diesel propulsion. The total tonnage of these tankers was 103,599 and their aggregate cost to their purchasers was \$3,444,452.

During the year the United States Shipping Board was able to supply an extra number of ships for use in exporting from the United States cotton, grain, flour, and other commodities, at a time when the British coal strike had stimulated high rates in the American coal export trade, so that unduly high rates did not prevent the regular and orderly movement of grain and flour to Europe. This movement of wheat and flour was followed by a similar condition in the cotton export trade.

In 1926, aside from the United States Lines, the Government did not directly control the management of the ships, and their actual operation was done by private concerns employed through the Emergency Fleet Corporation. It was proposed during the year that in the future the managing operators' compensation should depend upon the degree of efficiency with which they operated the Shipping Board ships. Minimum commissions would be paid on operation that resulted in maximum losses, and as the losses were reduced the rate of percentage paid to the operators for commissions would increase.

During the year Congress appropriated \$25,000,000 for converting some of the Shipping Board's vessels to Diesel propulsion, and on these craft internal combustion engines were being installed, the *Tampa* and the *West Honaker* being put in service at the end of the year. These new engines increased the speed of the vessels equipped about two knots, but did not bring them up to the standard of the cargo liners of other nations. It was believed that American vessels should be specially designed and equipped with these engines, to compete effectively with the shipping of other nations.

**SHIPWRECKS.** See SAFETY AT SEA.

**SHOES, SHOE INDUSTRY.** See BOOTS AND SHOES.

**SHOOTING.** The Dewar Cup, emblematic of the rifle-shooting championship of the world, was won by a British team in a match at Seagirt, N. J. This marked the first time that

America had lost possession of this trophy since 1912. In another international contest at Bisley, England, the 107th United States Infantry (N.G.N.Y.), defeated the Queen's Westminsters and Civil Service Rifles for the Howard Vincent Shield, thus retaining this trophy.

Trapshooting in the United States was again featured by the Grand American Handicap Tournament, held at Vandalia, Ohio. S. L. Jenny, of Highland, Ill., captured the national amateur championship, winning by a flip of a coin after four shoot-offs had failed to break a tie among the five leaders. The national professional championship was won by Fred S. Tomlin, of Glassboro, N. J., while Mrs. J. C. Wright, of Atlanta, Ga., triumphed in the women's singles. The all-around honors went to Frank M. Troek, of Portland, Ore.

**SHORTER, CLEMENT KING.** British journalist, editor and author, died at Great Missenden, England, November 19. He was born at London, July 19, 1857, and at the age of 20 he worked in the exchequer and audit department of Somerset House, London. He remained in this position until 1890, when he left to act as editor of the *Penny Illustrated Paper*. In 1892, however, he left this paper and was, for 9 years, editor of the *Illustrated London News*. In 1893 he founded for the same company *The Sketch*, a periodical which he edited for 7 years. He also founded *The Sphere* in 1900 and *The Tatler* in 1903. In addition to his editorial writings, Mr. Shorter wrote many books showing his knowledge of the styles and intentions of earlier writers. He was an acknowledged authority on the Brontë sisters; two of his books were *Charlotte Brontë and Her Circle*, (1896), and *Charlotte Brontë and Her Sisters*, (1905). Others among his numerous writings are: *C. K. S., an Autobiography*; (1924); *Napoleon's Fellow Travellers* (1909); the *Complete Works of George Borrow* (1923); and an edition of *Boswell's Johnson* (1922). He was a founder of the Omar Khayyam Club, and a former president of the Johnson Club.

**SHRADHANAND, SWAMI (MUNSHI RAM).** An Indian religious and political leader, was murdered at Delhi, December 23. Born in the Punjab, Jollundur district, in 1855, he was educated at Queen's College, Benares, and for 16 years after his graduation practiced as a pleader in his home town. Early impressed by the views of Swami Deyanand, founder of the Arya Samaj, he eventually joined that movement. Finally, in 1898, his convictions led him to give up legal work and start the Arya Samaj monastic college of Gurukola at Hardwar on the Ganges. He was in active charge of this school from 1902 to 1917, at which time he entered upon a stage of Sanyasi, giving up his house and beginning a purely religious life. For the next two years he preached religious doctrines throughout India and in 1919 he joined the Satyagraha (non-coöperation) movement started by Gandhi, organizing the Delhi hartal. He had a number of differences with the Indian National Congress, his activities leading to a short imprisonment at Amritsar. The Shuddhi movement which caused considerable trouble a few years previously to his death sprang from his conviction that if the Congress wanted home rule, two things were necessary—to destroy the existing educational system and

to accept the depressed classes into the Hindu fold. Accordingly, he began trying at Agra to convert to Hinduism the Malkana Rajputs, a very low order. This caused several riots between Mohammedans and Hindus, and probably was the indirect cause of the death of Shradhanand, as his assailant was said to be a Mohammedan fanatic.

**SIAM**, si-ām'. A monarchy in southeastern Asia, bounded by Burma on the west, French Indo-China on the east, and the Gulf of Siam on the south. Capital, Bangkok.

**AREA, POPULATION, ETC.** The area is estimated at 200,148 square miles and the population, according to the census of 1919-20, 9,207,355; estimated in 1924-25, 9,724,000. Passengers arriving at Bangkok in 1924-25 by sea numbered 85,768, mostly from Hongkong and China; departing, 58,260. Buddhism is the prevailing religion. On Mar. 31, 1925, there were 15,950 Buddhist temples and 127,341 priests. In 1923-24 government schools numbered 353, including 236 secondary departments, with 49,298 pupils (15,792 in secondary classes) and 1829 teachers. There were also 65 special (technical) departments in government schools with 1101 pupils, principally for the training of teachers. Local schools numbered 4377, with 510,663 pupils and 9474 teachers. Private schools numbered 474, with 25,484 pupils and 844 teachers. Over 90 per cent of the local schools and 60 per cent of the government schools are situated in temples. There is a university at Bangkok.

**PRODUCTION.** Agriculture is the principal occupation of the people, and the chief article of food as well as of export is rice. The cultivated area under rice in 1924-25 was 6,632,544 acres and the export 1,114,717 tons. The forest resources are extensive, and teakwood is an important product, the exploitation of which is almost exclusively in the hands of the British. On Mar. 31, 1925, the livestock consisted of 8150 elephants, 231,832 horses and ponies, 3,871,678 bullocks, and 4,131,724 buffaloes. The mineral resources are varied and extensive and include coal, zinc, tin, iron, tungsten, wolfram, manganese, and antimony. The total amount of metallic tin exported in 1924-25 was 10,883 tons.

**COMMERCE.** The larger part of Siam's trade with the world is carried on through the neighboring ports of Singapore and Hongkong, which serve as entrepôts for the transshipment of goods destined for or exported from the kingdom. While the official statistics of Siam reveal movements of goods, they give little indication of the real sources of the country's imports or the ultimate destination of its exports. It may be said in a general way that imports coming from Singapore originate in Europe, especially Great Britain, and those arriving from Hongkong are mainly of Chinese, Japanese, and American origin. Eighty-five per cent of the foreign commerce of Siam passes through the port of Bangkok. The imports in 1925-26 through this port were valued at £14,050,191 and the exports at £15,237,052. The principal imports are cotton goods, foodstuffs, metal manufactures, tobacco, and machinery. The chief exports are rice and teakwood.

**FINANCE.** The following table shows estimates of the 1924-25 and 1925-26 revenues and expenditures:

**SIAMESE ORDINARY REVENUES AND EXPENDITURES, 1924-25 AND 1925-26**

<i>Revenues</i>	1924-25, <i>estimated</i>	1925-26, <i>estimated</i>

Total expenditures chargeable to revenues .....	93,125,688	94,875,238

\* Value of tical = 37.09 cents.

The public debt of Siam as of Mar. 31, 1926, was £12,328,093.

**COMMUNICATIONS.** In 1924-25, 950 vessels of 1,001,119 tons entered and 952 of 1,005,496 tons cleared at the port of Bangkok. On Mar. 31, 1925, 1549 miles of state railway were open for traffic and 348 were under construction.

**GOVERNMENT.** Executive power is vested in the King, who is assisted by a consultative ministry comprising nearly all the King's relatives; and legislative power in a council composed of the state ministers and members appointed by the crown. King, Praja Dhipok, born Nov. 8, 1893, succeeded to the throne on the death of his brother, Rama VI, on Nov. 26, 1925.

**HISTORY.** The only event of interest noted in the press in the course of the year was the fact that the new customs law for Siam went into effect November 15. This law freed the country from an external customs control similar to that which has existed in China for years. The treaties which had controlled Siam's customs lapsed.

**SIBERIA.** The northern Asiatic part of Russia. Area, estimated in 1926 at over 5,000,000 square miles; population in 1924 estimated at 12,800,000. Rich and important as are the mining, forest and fur resources of Siberia, 90 per cent of the population lives in rural districts, and agriculture and the industries allied with it were not only the most important in 1926, but will remain so for a considerable time. It will take much capital not yet available, and a long period of time, to develop Siberia industrially. Siberia is one of the world's important sources of furs, and trapping is of considerable economic importance over large portions of the country, particularly in the forest and tundra region. In some localities it is the chief means of livelihood, while in others it supplements fishing and farming. The development of the mineral wealth of Siberia is second in importance only to the development of its agriculture. Incomplete exploration has revealed

resources that justify expectation that in time the mining industry will occupy an important place in the economic development of Siberia. The industries of Siberia include flour mills, distilleries, breweries, tanneries, and soap and tallow works. See RUSSIA.

**SIBLEY, JOSEPH CROCKER.** American oil pioneer and former congressman, died May 19. He was born at Friendship, N. Y., Feb. 18, 1850, and was educated at the academies in Springville and Friendship, N. Y. He was originally a manufacturer of lubricating oils, but interested himself in many other enterprises. After three years of experimentation he achieved the first successful substitute for petroleum for use in valves and cylinders of steam locomotives. He retired from active business in 1910, and thenceforward gave all his time to the study of soil fertility and experiments thereon, and to the investigation of plant life and its improvement. He was president of the Pennsylvania State Dairymen's Association, and was a member of the State board of agriculture. He was also a trustee of Bucknell University, a director of the American Jersey Cattle Club, and of the Allegheny River Improvement Association. One of his gifts was that of the Sibley Law Library to the Venango County, Pa., Bar Association. He was for some time mayor of Franklin, Pa., and was a member of the 53rd congress, 1893-95, and of the 56th and 57th congresses, 1899-1903, representing the 27th Pennsylvania district. He was a member of the 58th and 59th congresses, 1903-97, for the 28th district.

**SIERRA LEONE.** sê-ër'rá lê-ô'né. A British colony and protectorate on the west coast of Africa; bounded by French Guinea on the north and Liberia on the east and southeast. The approximate area of the colony is 4000 square miles and the population, according to the census of 1921, 85,163, of whom 1161 were Europeans. The chief town is Freetown, with a population in 1921 of 44,142. The birth rate in 1924 was 21.2 per thousand and the death rate 22.7 per thousand, infant mortality being 266 per 1000 registered births. In 1924 there were 111 primary schools, belonging to missionary societies and assisted from public funds, and 15 government primary schools. The average attendance in these 126 schools was 7774. For higher education there is Fourah Bay College, affiliated with the University of Durham. Freetown is the chief seaport in West Africa, being a coaling station and the headquarters of the British Imperial forces in West Africa. Vessels entered and cleared in the foreign trade in 1924 had a tonnage of 3,317,515. The total exports in 1924 amounted to £1,711,438; imports, £1,730,643; revenue, £868,319; expenditure, £777,790; public debt, £1,729,848. The total railway mileage open to traffic, with sidings, was 338 miles.

The protectorate is situated between 6° and 10° N. latitude and 10° and 14° W. longitude, and its greatest extension inland is 180 miles. Area, 27,000 square miles; population, according to the census of 1921, 1,456,148, of whom 1,450,903 were natives. The chief exports are palm kernels, kola nuts, and palm oil. It is divided into three provinces with a European commissioner at the head of each. The governor and commander-in-chief of the colony is also governor of the protectorate. He is assisted by an executive and legislative council. Governor and commander-in-chief in 1926, Sir A. R. Slater.

**SILESIA,** sl-ê'shâ. The term applied to (1) a former division of the Austro-Hungarian Empire; (2) a province of Prussia. The former, previously a crownland of Austria, became after the war a part of the new republic of Czechoslovakia (q.v.). Its area is 1708 square miles; population, according to the census of 1921, 672,268. The province of Silesia in Prussia was originally the largest division of that state, with an area of 15,573 square miles and a population of 5,225,962 in 1910. After a plebiscite in 1921, Upper Silesia was divided between Germany and Poland, leaving under the control of Prussia an area of 14,022 square miles (Upper and Lower Silesia), with a population in 1925 of 4,531,186; and transferring to Poland an area of 1240 square miles, with a population of 891,669 in 1921.

**SILK.** In the United States the consumption of raw silk during the year 1926 was 501,546 bales, and was slightly in excess of that of 1925 when 501,343 bales were absorbed by the various mills. The scale of prices was definitely downward over the greater part of the year and the price situation was influenced by a general deflation taking place in Japan and also by conditions in silver exchange which were felt in China. In manufactures of silk the hosiery mills were active during the year, and, with reduced costs of raw material, they were believed to have made a fair profit. The broad silk mills were not as fortunate, due in a measure to overproduction and sacrifice sales, but there was a strong demand for silk manufactures of all kinds during the year which enabled them to get along without serious losses.

In 1926 the United States imported and used in manufacturing more raw silk than in any other year in the history of the silk industry. Raw silk prices in the New York market had a distinct downward tendency during the year as distinct from the previous year, when fluctuations were comparatively narrow and the trend upward. The decline in prices of Japanese raw silk during the year amounted to approximately 18 to 20 per cent, the downward swing coming after April, with irregular and uncertain conditions prevailing until the middle of November, when a steady decline continued until the end of the year. In China silks the low market was reached in May, from which time there was a recovery until the end of July, at which time a decline set in, but toward the end of the year prices were more stable. Tussah silks showed a gain over the opening of the year, while raw silk imported from Italy showed a decline in value.

The United States imported silks and manufactures of silk to a total value of \$443,245,399, during 1926 as compared with \$445,105,116 in 1925. There was an increase in the amount of raw silk, nearly 66,422,192 pounds, as compared with 1925, when the imports totaled 63,764,361 pounds, but the value in 1926 was \$392,750,684, as compared with \$396,286,471 in 1925. In 1926 there were also imported 11,132,975 pounds of silk waste valued at \$9,808,390, a decline both in amount and value from 1925. The imports of manufactures of silk in 1926 aggregated a value of \$40,569,818, as compared with \$36,719,080 in 1925. The 1926 imports were made up as follows: spun silk, 581,810 pounds, valued at \$1,824,305; broad silks, 3,738,949 pounds, value \$18,626,517; pile fabrics, 428,

\* The production of raw silk in China is an unknown quantity.

† Excludes tussah silk.

The domestic consumption of raw silk (including tussah) in China is estimated to be 55 per cent of the production. The exports from Canton and Shanghai during the season 1925-1926 were 18,601,000 pounds, which would indicate a crop of approximately 41,885,000 pounds.

The Japan crop is estimated at 71,000,000 pounds.

317 pounds, valued at \$2,839,394; silk wearing apparel to the value of \$8,334,279; and silk laces and embroideries to \$4,259,412. In 1926 the United States exported silk manufactures to a total amount of \$17,788,377, as compared with \$18,181,846 in 1925. These exports were made up as follows: broad silks, 3,200,825 yards, valued at \$3,860,961; silk wearing apparel, except hosiery, to the value of \$1,710,023; silk hosiery, 960,418 dozen pairs, valued at \$8,995,012.

**SILK, ARTIFICIAL.** See RAYON.

**SILVER.** A number of events combined to reduce the price of silver during the year 1926 and on October 19 silver sold in New York for 51½ cents an ounce, the lowest price touched since Nov. 20, 1915. The principal causes for the decline in the silver market were stated as increased production, internal strife in China, and the report of the Royal Commission on Indian Currency and Finance. (See INDIA.) The world's production in 1926 was estimated at 241,600,000 ounces by Handy and Harman, New York, and at 246,000,000 ounces by *Engineering and Mining Journal* in its annual Review. The accompanying table from the *Journal* gives the world's production of silver over recent years.

In the first half of 1926 a price of over 65 cents an ounce stimulated activity in silver mines the world over, but in the latter half of the year the price decline was felt, particularly in Mexico, though the production in Canada increased and also that of South America.

tion of silver in the United States during the calendar year 1926:

\* Figures prior to 1926 from American Bureau of Metal Statistics; those for 1926 estimated from the Bureau's figures and other data.

The Bureau of the Mint of the U. S. Treasury Department, with the cooperation of the Bureau of Mines, has issued the following statement of the preliminary estimate of refinery produc-

was the year of the greatest output of silver ever recorded for the United States according to the Director of the Mint, 74,961,075 ounces having been produced that year.

**SIMMONS COLLEGE.** A non-sectarian college for women at Boston, Mass.; founded in 1899. The enrollment for the autumn of 1926, on November 1, was 1400, distributed as follows: household economics, 305, secretarial studies, 462; library science, 197; general science, 60; social work, 149; store service education, 61; public health nursing, 163; students in economic research, 3. There were 232 registered in the 1926 summer session. The faculty numbered 122 active members, and 5 on leave of absence. The productive funds of the institution amounted to \$3,286,747.75, and the income for the year to \$449,509.63. The library contained 39,600 volumes. President, Henry Lefavour, Ph.D., LL.D.

**SIMON, HENRI.** French statesman and president of the French Chamber's commission on finance, died in Paris, December 2. He was born in 1874, and in early life studied law but became a manufacturer. He soon took an interest in political affairs, and after his election to the Conseil General he obtained, in 1910, for the first time, a seat in the Chamber. He sat as a deputy for the Department of Tarn, and belonged to the Radical Socialist group. He became a member of the French Government in the later war period, when Clémenceau made him colonial minister. He at once effected important reforms, changing appointments as governor as occasion demanded and sending M. Jonnart as governor to Algeria. Owing to his experience in law and finance, M. Simon was elected a member of the Caillaux debt mission to the United States.

**SINGAPORE.** See STRAITS SETTLEMENTS.

**SINGING.** See MUSIC.

**SINGMASTER, JOHN ALDEN.** American theologian, died February 27. He was born at Macungie, Lehigh County, Pa., Aug. 31, 1852, and took his A.B. degree at Pennsylvania College, Gettysburg, in 1873. He was ordained to the Lutheran ministry in 1875, and was graduated from the Lutheran Theological Seminary in 1876. From 1876 to 1882 he was pastor at Schuylkill Haven, Pa., leaving to take up the pastorate at Macungie, Pa., where he remained until 1886. From 1900 he was associated again with the Lutheran Theological Seminary, first as professor of Biblical theology, 1900-1903, then as professor of systematic theology, 1903 onward, becoming president of the seminary in 1906. He was senior editor of the *Lutheran Quarterly*, of Gettysburg, and was president of the General Synod of the Evangelical Lutheran Church in the United States, in 1915. He was one of the founders of the United Lutheran Church in America, in 1918, and most of his work was directed toward the accomplishment of denominational unity. From 1887-1890 he was in Brooklyn, N. Y.; from 1890-1900 in Allentown, Pa. In 1894 he received the degree of Doctor of Divinity from Pennsylvania College, and in 1920 that of LL.D. from the same institution.

**SISTERMANS, ANTON.** Dutch basso, died at The Hague, February 6. He was born at s'Hertogenbosch, Aug. 5, 1865. In 1890 he abandoned a business career in Rotterdam and began his vocal education under Stockhausen in Frankfurt. After only six months of study he made a brilliant début in Verdi's *Requiem* at Strassburg, 1891, but continued his work under Stockhausen for four years. From 1895 on he appeared in all the important cities of Germany, where he was regarded as one of the very greatest of oratorio and lieder singers. The stage

never attracted him, although in the summer of 1899 he won great applause for his splendid interpretation of the rôle of Pogner in *Die Meistersinger* at Bayreuth. From 1904-17 he lived in Berlin as a teacher, highly esteemed as an exponent of the Stockhausen method. From 1917 until his death he had charge of the opera class at the royal conservatory at The Hague.

**SKATING.** Charles Gorman, of St. John, N. B., won the world's amateur ice-skating championship in 1926, succeeding as title holder Clas Thunberg, of Finland, who had captured the Olympic championship in 1924. The meet in which the title was won was held at St. John, Gorman scoring a total of 140 points. Thunberg tallied only 10 points, finishing in sixth place. Thunberg also made a poor showing in his first indoor appearances in New York City, but later, at the annual meeting of the Board of Control of the International Skating Union, held at Detroit, Mich., he set five new outdoor records. O'Neill O'Farrell, of Toronto, Canada, won the United States national outdoor championship, while E. Myers took the indoor title. The women's championship went to Miss Leila Brooks, of Toronto, who also was credited with two outdoor records, 1 minute 36 seconds for the half mile and 44 $\frac{3}{4}$  seconds for 440 yards. Miss Elsie Muller, of New York City, set two new indoor marks, skating 220 yards in .223 $\frac{3}{4}$  seconds and 440 yards in 45 $\frac{3}{4}$  seconds, turning in both performances on the same day.

**SKYSCRAPERS.** See ARCHITECTURE.

**SLATE.** The value of the slate sold at the quarries of the United States in 1926 was \$12,030,000, or 4 per cent less than the value reported for 1925, according to estimates compiled by the U. S. Bureau of Mines. Slate reported sold for electrical, structural and sanitary, and miscellaneous uses (chiefly flagstones) showed increase in both quantity and value, while the other products decreased. Roofing slate sold amounted to 455,000 squares, valued at \$4,832,000, a decrease of 8 per cent in quantity and 5 per cent in value. There was an increase of 34 cents in the average value per square. The total sales of mill stock amounted to 9,831,000 square feet, valued at \$4,084,000, a decrease of 11 per cent in quantity and 3 per cent in value. Sales of structural slate—2,410,000 square feet, valued at \$937,000—increased 3 per cent in quantity and 9 per cent in value. Sales of electrical slate, estimated at 1,872,000 square feet, valued at \$1,565,000, increased 13 per cent in quantity and 14 per cent in value. Sales of mill stock for blackboards, which was the only variety of mill product that showed increased sales in 1925, decreased 27 per cent in quantity and 23 per cent in value in 1926. The estimated output was 3,760,000 square feet, valued at \$1,298,000. The sales of crushed slate for roofing granules and flour in 1926 was estimated at 495,700 short tons, valued at \$3,034,000, which was practically the same quantity as in 1925. The average value per ton was lower than in 1925.

**SLAVIC STUDIES.** See PHILOLOGY, MODERN.

**SLEEPING SICKNESS.** See SMALL POX AND VACCINATION.

**SMALL, ALBION WOODBURY.** American sociologist, died March 24. He was born at Buckfield, Maine, May 11, 1854, and graduated from Colby College in 1876. He then went to the Newton Theological Institute, 1876-79, and

studied also at the Universities of Berlin and Leipzig, 1879-1881. In 1881 he returned to become professor of history and political economy at Colby College, in which capacity he remained until 1888. He then became reader in history at Johns Hopkins University, 1888-89, and in 1889 he received from that institution the degree of doctor of philosophy. From 1889 to 1892 he was president of Colby College. In 1892 he went to the University of Chicago as head of the department of sociology, and in 1900 he was given the degree of LL.D. by Colby. In 1905 he became dean of the graduate school of arts and literature, University of Chicago, holding that position when he died. From 1895 he was the editor of *The American Journal of Sociology*; among his published works are: *General Sociology* (1905); *Adam Smith and Modern Sociology* (1907); *The Meaning of Social Science* (1910), and many articles in journals and magazines.

**SMALL POX AND VACCINATION.** Beginning some time in 1925, physicians in Holland, Germany, and Switzerland reported to the proper health authorities that scattered cases of cerebral disease had developed during the first week after vaccination, and that contaminated lymph could not be accused. The total number was not large, not over fifty, and was scattered over a very wide area. From the resemblance to lethargic encephalitis, it was at first thought that children about to develop this malady had been vaccinated during the incubation period, so that nothing more than a coincidence was involved. A modified view was that the victims harbored the germs of the disease in question, and that the shock of vaccination had precipitated the outbreak. Since the flurry of cases soon subsided, little chance was given for a study of the disease. Medical societies and health boards began an investigation in the affected localities, and, pending reports, orders were issued to dilute the lymph considerably more than usual and to refrain, for the time being, from vaccinating all ailing and delicate children.

Thus far, no reports on these cases seem to have been made in the countries affected, but in April, 1926, the attention of the ministry of health of Great Britain was called to the subject. Although no cases had been reported for that country, an investigation of past records was ordered. The report of this investigation is found in the *Lancet* for September 4. All deaths following vaccination were subjected to inquiry for years back. It was found that during the past 14 years 7 such cases had come to light in Great Britain. These are reported in full in the *British Journal of Experimental Pathology* for October. The disease was described as encephalomyelitis, and there is no connection apparent between this affection on the one hand and epidemic encephalitis or poliomyelitis on the other. A crucial point was the possibility that this affection may complicate small pox; in such case there is the greater likelihood of it as a result of vaccination. The investigation then turned to small pox, and the report states that encephalomyelitis, while a very rare complication, has sometimes developed as a result of the disease.

For the past ten years, lethargic encephalitis, or "sleeping sickness," has appeared in most of the countries of the world, and is practically

a new disease. This, in the opinion of many, indicates a lowered resistance of the brain tissues to certain infections. If the brain of civilized man is becoming more vulnerable in this respect, it may throw a little light on these cases.

**SMITH, EDMUND MUNROE.** American jurist, died in New York, April 13. He was born at Brooklyn, N. Y., Dec. 8, 1854, and graduated from Amherst College, in 1874. In 1877 he took the LL.B. degree at Columbia University, having studied law under Professor Dwight. He then went abroad and took the J.U.D. degree at the University of Göttingen. In 1880 he was made instructor of history at Columbia, and on the creation of a professorship of Roman law and comparative jurisprudence in 1883, Mr. Smith became the first incumbent. He had given special attention for some years to the subject of legal history, and in 1891 he was made Bryce Professor of European Legal History. When in 1886 it was decided to inaugurate the *Political Science Quarterly*, Professor Munroe Smith was made its first editor. In 1904 Columbia University conferred upon him the honorary degree of Doctor of Laws, and Amherst College gave him the same honor in 1916. In appreciation of his services to legal history, the University of Louvain made him a Doctor of Jurisprudence in 1909. Professor Munroe Smith was for 45 years a member of the Columbia faculty and he resigned the professorship of Roman Law and comparative jurisprudence in 1922. He wrote *Bismarck and German Unity* (1898, 3d edition 1923), and after the outbreak of the World War, *Out of Their Own Mouths* (1917) and *Militarism and Statecraft* (1918).

**SMITH, ERNEST ASHTON.** American educator and president elect of Toledo University, died December 28, at Piqua, Ohio. He was born in Ohio in 1868, and after attending school in Piqua, O., entered Ohio Wesleyan University in 1884, where he graduated in 1888. Later he studied and received degrees at Johns Hopkins and Oxford Universities. From 1910 to 1913, he was assistant professor at Princeton University and in the latter year went to Allegheny College as professor, serving until 1916. Professor Smith was superintendent of schools in Salt Lake City, Utah, 1916-20 and at Evanston, Ill., from 1920 to 1925. He was president of the State Normal School at Lacrosse, Wis. He had been appointed president of Toledo University, and was to have taken up his duties at the end of the holidays in which his death occurred.

**SMITH, MERRITT HAVILAND.** American civil engineer and chief engineer of the Department of Water Supply, New York City, died December 9, in New York, N. Y. He was born in New York, in 1862, and was graduated from the Pennsylvania Military College in 1880 with the degree of civil engineer. In 1884 he entered the service of New York City, and the greater part of his life was spent in city engineering work, largely in connection with the old and new Croton Aqueducts and the Catskill Aqueduct. He had been since 1914 Chief Engineer of the Bureau of Water Supply. He served in the Spanish-American War in 1898 in Porto Rico and on the Mexican border in 1916 with the New York National Guard, being Colonel of the First Field Artillery. He served overseas with

the 104th Field Artillery in 1918-19, taking part in the Meuse-Argonne offensive.

**SMITH, OBERLIN.** American engineer and inventor, died July 19, at Bridgeton, N. J. He was born at Cincinnati, Ohio, Mar. 22, 1840, but soon after was brought to Bridgeton, N. J. He was educated at the West Jersey Academy, in that town, and at the Polytechnic Institute, Philadelphia, Pa. In 1863 he started the business later known as the Ferracute Machine Works, inventing and designing the products of the company. He invented and patented 52 presses and dies, extensively used in the machine shops. Among his inventions were the dies from which Chinese money was stamped. Mr. Smith was at one time president of the American Society of Mechanical Engineers. In 1896 he published his *Press Working of Metals*, and *The Material, Why Not Immortal?* appeared in 1920.

**SMITH, SIDNEY IRVING.** American biologist and anatomist, died May 7. He was born at Norway, Me., Feb. 18, 1843, and studied at the Sheffield Scientific School of Yale University, graduating in 1867. From 1867 to 1875 he was assistant in zoology at Sheffield, becoming professor of comparative anatomy there in 1875, serving until 1906, when he was made professor emeritus. He was in charge of the deep-water dredging on Lake Superior for the United States Lake Survey in 1871, and for the United States Coast Survey about St. George's Banks, in 1872. For many years he was engaged in biological work with the United States Fish Commission. Since 1884 he had been a member of the National Academy of Sciences. His research work was hampered by blindness which supervened some years before his death.

**SMITH COLLEGE.** A non-sectarian college for women at Northampton, Mass.; founded in 1871. The enrollment for the autumn of 1926 was 2136, including 65 graduate and 4 non-collegiate students. There were 204 faculty members. The productive funds amounted to \$4,660,688.18, and the income from these funds to \$275,801.72. Three new dormitories and the Tryon art gallery were opened for use in September of 1926, completing the quadrangle. Spending the year in study in France were 34 members of the junior class. The library contained approximately 130,000 volumes. President, William Allan Neilson, Ph.D., L.H.D., LL.D.

**SMITHSONIAN ASTROPHYSICAL OBSERVATORY.** See **ASTRONOMY**.

**SMITHSONIAN INSTITUTION.** An organization founded in 1846, according to the terms of the will of James Smithson of England, who, in 1826, bequeathed his property to the United States of America to "found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." In receiving the property and accepting the trust, Congress determined that the Federal Government was without authority to administer the trust directly, and therefore constituted an "establishment" whose statutory members are the President, the Vice President, the Chief Justice, and the heads of the executive departments. The affairs of the Institution are administered by a Board of Regents, whose membership consists of the Vice President, the Chief Justice, three members of the Senate, and three members of the House of Representatives, together with six

other persons, other than members of Congress, two to be residents of Washington and the other four citizens of four different States. The Chancellor of the Institution in 1926 was Chief Justice Taft. The Institution administers for the Government the following bureaus: The National Museum, the National Gallery of Art, the Freer Gallery of Art, the Bureau of American Ethnology, the International Exchange Service, the National Zoological Park, the Astrophysical Observatory, and the United States Regional Bureau of the International Catalogue of Scientific Literature.

The two outstanding researches in progress during the year were the geological and paleontological studies of the Canadian Rocky Mountain region which had been conducted by Dr. Charles D. Walcott for 20 years, and the study of the radiation of the sun and its relation to weather on the earth by Assistant Secretary C. G. Abbot. Many other researches in various phases of geology, biology, anthropology, and astrophysics are carried on under the direction of the Institution.

During 1926, the Institution sent out or cooperated in 35 field expeditions in various parts of the world in the interests of astrophysics, geology, paleontology, archaeology, biology, including zoology and botany, and ethnology, resulting in important additions to knowledge and accessions of valuable material to the great collections of the National Museum. These expeditions not only visited various parts of the United States, including Alaska, but also Canada, South and Central America, Africa, Europe, China, Sumatra, Siam, and the West Indies.

The publications of the Institution, issued in eleven series, are its principal means of carrying out its purpose of the "diffusion of knowledge." These publications have a widespread circulation. The *Smithsonian Annual Reports* contain special articles presenting in readable form progress and interesting developments in all branches of science. During 1926 there were issued 88 volumes and pamphlets, of which 168,932 copies were distributed to libraries, colleges and universities and other educational institutions, and individuals.

The income of the Institution, averaging about \$65,000, is derived from the interest on its endowed funds, which in 1926 amounted to a little over a million dollars. It is also charged by Congress with the disbursement of the government appropriations for the support of the bureaus under its administrative charge. The secretary of the Institution in 1926 was Dr. Charles D. Walcott and the assistant secretaries were Dr. C. G. Abbot and Dr. Alexander Wetmore. The officers in charge of the bureaus under the direction of the Institution were as follows: National Museum, Alexander Wetmore, Assistant Secretary in Charge; National Gallery of Art, W. H. Holmes, Director; Freer Gallery of Art, J. E. Lodge, Curator; Bureau of American Ethnology, J. Walter Fewkes, Chief; International Exchange Service, C. G. Abbot, Assistant Secretary in Charge; National Zoological Park, W. M. Mann, Director; Astrophysical Observatory, C. G. Abbot, Director; U. S. Regional Bureau of the International Catalogue of Scientific Literature, L. C. Gunnell, Assistant in Charge.

**SNOW REMOVAL.** See **ROADS AND PAVEMENTS**.

**SOAPSTONE.** See **TALC AND SOAPSTONE**.

**SOCCER.** Many international contests served to inspire increased interest in soccer in 1926. The Sparta eleven from Prague, Czecho-Slovakia, visited the United States and engaged in a large number of games against leading American teams in the Eastern and mid-Western states. The invaders displayed a high brand of play, and succeeded in capturing considerably more contests than they lost. A team from Worcester, Mass., lost a series of games played in England to the Worcestershire soccer men, and a return series was to be contested in the United States in 1927. The Bethlehem Steel eleven won the National Challenge Cup, carrying with it the United States Football Association championship. The steelmen defeated the Ben Miller Football Club of St. Louis, Mo., in the final game played at Ebbets Field, Brooklyn, N. Y., by a score of 7 to 2. Fall River, for the third successive year, captured the American Soccer League title. Princeton retained its championship crown in the intercollegiate league.

**SOCIAL INSURANCE.** See **WORKMAN'S COMPENSATION**; **MATERNITY PROTECTION**; **OLD-AGE PENSIONS**.

**SOCIALISM.** The action of the international Socialist movement continued to be divided. On the one hand, the parties and trade unions affiliated with the Labor and Socialist (or Second) International exercised a moderate influence in the direction of liberal and radical legislation, and seconded the work of the International Labor Organization at Geneva. The Communist (or Third) International Organization, however, kept up its subversive and revolutionary policies, although it was much weakened by the political overturn within the Communist Party in Russia. A motion to bring together the two organizations on a common platform was overwhelmingly defeated at a conference of the Labor and Socialist International at Zurich. The unity plan had the support of the British Independent Labor Party, but it was strenuously opposed by the delegate from the regular British Labor Party.

The Labor and Socialist International convoked a congress on world migration, a report on which is given below. In addition, it had several executive conferences, and it took action to support the British general strike. This action was chiefly moral, except for the contributions which the European trade unions voted on their own account, and it contrasted sharply with the policy of the Third International. The latter organization offered a big subsidy to the general strike committee, which refused to accept it. The money thereupon was given to the striking British miners, enabling them to prolong their strike. A report of the November meeting of the presidium of the Communist International (based upon a dispatch to the *New York Times*) is given below.

**WORLD MIGRATION CONGRESS.** One hundred and twenty delegates, representing 15,000,000 trade unionists and 25,000,000 voters, attended the congress on workers' migration summoned by the Labor and Socialist International. The

congress was held in London, June 22 to 25. The congress split on the fundamental question of the freedom of migration. While the delegates from such countries as Great Britain, Germany, Italy, Austria, and Poland championed the cause of free migration—with due weight to economic considerations—the delegates from the newer countries, particularly from Australia, Canada, and New Zealand, insisted on the right of each country to decide the question of immigration for itself. The doctrine of a "white" Australia was stoutly upheld by Prime Minister Bruce of Australia, and his stand was responsible for the defeat of the following resolution, introduced by Dr. Friedrich Adler of Vienna and supported by the European group: "The congress holds firmly to the principle of freedom of movement. There must be no restriction of such movement for political reasons. Economic influences may, however, temporarily restrict immigration."

The resolutions that the congress actually adopted were much more moderate in tone. These resolutions were preceded with a preamble explaining that the present rush of workers to economically favored countries was the result of the failure of the demand in world markets to keep up with the increase in the rate of production, thus producing unemployment as well as huge surplus stocks of goods. The transfer of workers, the congress believed, was no real solution of the problem, and such a transfer was moreover recognized as a potential menace to the labor and living standards of the more fortunate countries.

**COMMUNIST INTERNATIONAL.** Gregory Zinovieff, head of the Communist International since its inception, and partisan of world revolution, resigned his position on October 23. His resignation was simultaneous with the ousting of Leon Trotsky and Leon Kamenef from the political bureau of the Russian Communist Party, and reflects a change of policy on the part of the governing group in Soviet Russia. Soviet policy was being dictated by Stalin, who, both in national and international questions, was inclined to practical opportunism while maintaining unchanged the letter of orthodox doctrine. In practice, therefore, a moderation of Communist international policy was to be expected.

**UNITED STATES.** The action of the Socialist Party in the United States continued to be politically negligible. In the New York gubernatorial election, Mr. Thomas polled about 50,000 votes. Congressman Berger of Milwaukee was re-elected to his office, and remained the only Socialist in that body. The Workers' Party or Communist group continued its attempts to "bore in" within the ranks of American labor unions. For an account of these activities, see under **STRIKES**.

**SOCIAL PROGRESS, INTERNATIONAL ASSOCIATION FOR.** Forward looking action was taken on a number of pressing issues in the field of protective labor legislation, at the first meeting of the International Association for Social Progress, held at Montreux, Switzerland, Sept. 22-24, 1926. This international association, of which the Association for Labor Legislation is the American section, was created in 1925, it will be remembered, by amalgamating three former allied organizations, the International Association for Labor Legislation, the Interna-

tional Association on Unemployment and the International Social Insurance Committee.

Eight questions were included in the agenda of the Montreux meeting: 1, The legal situation of salaried employees; 2, accident prevention; 3, credit control as a means of preventing periodical unemployment crises; 4, public-works programme as a method of combating unemployment; 5, international transfer of rights acquired in connection with social insurance; 6, the cost of social insurance; 7, the legal situation of foreign workers; 8, the cost of social legislation. Seventeen countries were represented by delegates from national sections of the association. In addition, the governments of 10 of these countries sent representatives, and the official International Labor Office at Geneva was represented by its director. The meeting urged intensive work to bring about unconditional ratification by all countries of the convention adopted by the various sessions of the official International Labor Conference, particularly the convention for the eight-hour day.

**PROTECTION OF SALARIED EMPLOYEES.** Confirming a resolution adopted in 1922 by the International Association for Labor Legislation calling for an inquiry into the situation of salaried employees in private undertakings, the meeting declared that the results of this inquiry "prove that the protection of salaried employees is more than ever necessary." It urged that all international conventions and recommendations, "existing or to be adopted in the future," should apply as far as possible to salaried employees as well as to other classes of workers, and that the International Labor Office should endeavor to carry out this policy. It called for regulation of working hours of these employees, including the eight-hour day and one day of rest in seven. "Women employees," the resolution declares, "should not be dismissed as a result of any interruption in their work caused by pregnancy or childbirth. When the contract of service is denounced by the employer within the period from six weeks before to six weeks after childbirth, it should not actually terminate until eight weeks after childbirth. The Washington convention on the subject should be amended in this sense."

Subjects of new national and international regulations for salaried employees put forward include the abolition of agreements forbidding an employee in leaving one employer to accept a position with a competitor; and standards for paid holidays, for payment of wages when the employee is prevented from doing his work through no fault of his own, for notices of dismissal and resignation, for indemnity for cancellation of contracts, and protection of inventors. The meeting voted to continue the inquiry undertaken in 1922 with a view to securing documentary information on the following questions: 1, methods of combating unemployment among salaried employees (relief for the unemployed, employment exchanges, occupational reeducation, protection of aged employees, emigration, etc.); 2, protection of apprentices and occupational training; 3, protection for inventions made by employees; 4, privileges in the event of bankruptcy or liquidation; 5, Labor inspection and control of the protection of employees, and 6, reciprocity in regard to social insurance.

**PREVENTION OF INDUSTRIAL ACCIDENTS.** A reso-

lution was adopted requesting the International Labor Office to continue its work for accident prevention, with especial attention to automatic couplings on railways, substitution of round for square shafts on planing machines in the wood industry, and safeguards against coal-mine accidents, such as use of electric lamps; and rock dusting of mines to prevent disasters due to coal-dust explosions. National sections of the association are asked to study the progress made in these directions in their respective countries.

**INTERNATIONAL TRANSFER OF SOCIAL INSURANCE RIGHTS.** Urging universal adoption of social insurance measures to protect employees "against loss of capacity to work or earn a living," the meeting declared that "it is of special importance, under post-war conditions, to allow insured persons passing from one country to another to preserve the rights in this connection which they have acquired or are in course of acquiring." Principles are suggested on which special bilateral treaties between countries should be based, where necessary to insure "equality of treatment" to such insured persons.

**THE COST OF SOCIAL INSURANCE.** Declaring that "the association sees in social insurance the best method of guaranteeing wage earners against the vicissitudes of life," a resolution pledges coöperation with the International Labor Office in calculating the "social charges" in the various countries. In some quarters, it is noted, there is a demand for a reduction of "social charges"—expenditures made to protect workers against hazards of earning their own living and expenses incurred with a view to securing the livelihood of large families—and "this idea of 'social charges' is spreading from one country to another, and the sense given to it makes it a danger for social insurance." But, the association points out: "In calculating social charges, account should be taken of other forms of social relief granted to wage earners under a labor agreement or in virtue of legislation. It is of importance in this connection that, for each risk separately, account should be taken of benefits in cash, benefits in kind, and preventive measures. Family charges should also be considered. The association declares its intention of using the results obtained by the International Labor Office, of comparing them as between one country and another, and of showing their intrinsic value." The association "considers it of real urgency that large families should be protected by a system of insurance which takes account of their requirements."

**INTERNATIONAL CREDIT CONTROL.** Following the publication in the journal of the association of the report and conclusions prepared by Max Lazard on international credit control for the purpose of preventing periodical crises of over-production and unemployment, a special committee will study the subject further, and the association will take up the question again at a later session.

**PUBLIC WORKS AND UNEMPLOYMENT.** The association recommends that "wherever it has not already been done, independent and permanent organizations of experts should be set up" to collaborate with the authorities concerned in promoting the long-range advance planning of public works as an aid in stabilizing employment. The association holds: "In order to attain the object sought, and with a view to

legislative regulation of the question, public opinion should be instructed on the possibilities of alleviating fluctuations in the labor market by a systematic and rational distribution of public works. Public opinion must be made to understand that if this work is better distributed between busy and slack periods, it will cost less and will be more productive."

The association publishes a periodical, *L'Avenir du Travail*, edited by Dr. Stephane Bauer, at the international headquarters at Basle, Switzerland.

**SOCIAL PSYCHOLOGY.** See PSYCHOLOGY, under *Social Psychology*.

**SOCIETY ISLANDS.** See OCEANIA, FRENCH ESTABLISHMENTS IN.

**SOCIETY OF CHEMICAL INDUSTRY.** See CHEMISTRY, INDUSTRIAL.

**SOILS.** More efficient crop production is the primary purpose of soil investigation and improvement. With this purpose in view, unusual efforts were being made so to adjust soil and crop that there might be a larger and better product from fewer acres, with lower cost of production. It has been made clear that efficient production depends not so much upon extension of the cropped area as upon better utilization of the tillable lands available, the full capacity of which for profitable production has by no means been reached or even approached. Investigations recently reported by the United States Department of Agriculture indicated that farm lands in the older sections of the country were not on the average declining in productiveness, but were actually increasing in average yield per acre of certain staple crops. This justified the extension and intensification of the effort to get a larger and better product per acre as well as per man. And this was further justified by the fact that cost of production usually varies inversely with yield per acre.

The soil surveys were being supplemented with an increasing number of crop and fertilizer experiments on the various soil types, to find what should be done to fit them for the crops it was desired to grow. A study made by the United States Bureau of Soils of long-continued soil fertility experiments in the United States and England indicated that crop rotation, especially one including a legume, was a very effective means of maintaining an increasing yield of cereals, and that the effect of rotation was increased by the use of commercial fertilizer and also by liming in the case of acid soils. The world-wide search, led by Great Britain, for additional lands suitable for cotton culture was continued. While large areas suited as regards climate and soil conditions had been found in the Sudan, India, South Africa, and elsewhere, their remoteness, the scarcity of labor, and other unfavorable conditions, seemed likely to preclude their rapid or complete development.

The systematic and country-wide survey of the United States was continued by the Bureau of Soils. Detailed surveys of 15,500,160 acres and reconnaissance surveys of 2,744,960 acres were completed during the year, making the total area covered in 1926 by detailed surveys 453,548,800 acres and by reconnaissance surveys 367,527,680 acres. Besides these regular surveys, special studies were made of certain fruit and nut soils of California, melon and vegetable producing soils in Arizona, tobacco and cane soils in

Cuba, and others. Die-back, responsible for the destruction of orchards in one of the important prune-growing districts of California, was found to be associated with decidedly calcareous subsoils. The quality of the soils producing the best Cuban tobacco was determined, and it was found that they resembled closely some of the soils of the Atlantic and Gulf coastal plains of the southern United States. The tropical soils showed high friability, low shrinking and swelling qualities, excellent porosity, and strong resistance to erosion.

A simple test for determining the fertilizer requirements of corn on different kinds of soil was announced during the year. In this test, proposed by G. N. Hoffer of the Indiana Experiment Station, the need of nitrogen fertilizer was determined by splitting lengthwise a stalk cut after the ears are well developed, and applying a solution of sulphuric acid containing a few drops of diphenylamine to the cut surface. If the plant has had sufficient nitrogen the tissues will turn blue. If there has been an insufficiency of nitrogen the tissues will be of a yellow-green color. A lack of potassium is detected by red coloration when a solution of potassium thiocyanate is applied to the tissues of the nodes or joints of the stalk. Use of the test in a field survey in several States of the corn belt indicated a lack of available potash in many fields in southern Illinois, Indiana, and Ohio.

Investigations on toxic substances in soil indicated that while these might occur as a result of unfavorable reaction, unsuitable nutrients, and inadequate aeration, organisms were generally present which eventually destroyed the toxins unless the soil conditions were continuously unfavorable. Study of the nature and functions of soil colloids, especially in their relation to the moisture and plant-food supply of soils and to tilth and the operation of tillage implements, was receiving increased attention. Since the nature of the colloids present was found to determine to a considerable extent the productiveness of the soil, it was important to know the kind of colloids in different types of soil. The Bureau of Soils proposed a water-vapor adsorption method for determining both the kind and quantity of colloid in a soil.

Agricultural engineers gave much attention to soil dynamics, especially with reference to tillage, with the indication that through such studies the necessary tillage operations might be simplified without loss of efficiency, and tillage implements improved.

**SOLDIERS' ADJUSTED COMPENSATION.** See UNITED STATES.

**SOMALI COAST.** See FRENCH SOMALI COAST.

**SOMALILAND, ITALIAN.** See ITALIAN SOMALILAND.

**SOMALILAND, s6-mä'lä-länd, PROTECTORATE.** A protectorate belonging to Great Britain on the Gulf of Aden, bounded by Italian Somaliland, Abyssinia, and the French Somali coast. Area, about 68,000 square miles; population estimated at 344,000, nearly all Mohammedan and entirely nomadic except on the coast where permanent settlements have been made. The chief town is Berbera, with 30,000 inhabitants, at the census of 1921. Other towns are Lulhar, with 7300, and Zeyla, with 7000. The main source of wealth in the interior is stock raising. The principal imports are dates, sugar, textiles, rice, and specie, and the principal ex-

ports are hides and skins, gums and resins, cattle and sheep, and glue. The only forms of transport are by camel and motor car. The government is under the British Colonial Office, which is represented by a local governor and commander-in-chief. Governor, H. B. Kittermaster, appointed Jan. 28, 1926.

**SONG RECITALS.** See MUSIC.

**SOUTH, UNIVERSITY OF THE.** A Protestant Episcopal institution of higher education at Swannee, Tenn.; founded in 1857. The enrollment for the fall term of 1926 was 294, of whom 277 were registered in the college and 19 in the theological school. There were 43 students in the summer quarter, 27 of whom returned for the fall session. The faculty had 27 members, exclusive of student assistants. The income from productive funds was \$80,000, and the receipts from all sources, \$338,000. During the year a new dormitory was built. The library contained 41,358 volumes. President, Benjamin Ficklin Finney, LL.D.

**SOUTH AFRICA, UNION OF.** A self-governing dominion of the British Empire, comprising the provinces of the Cape of Good Hope, the Transvaal, Natal, and the Orange Free State; constituted a legislative union by the South African Act of September, 1909.

**AREA AND POPULATION.** Total area, 472,347 square miles; divided as follows: Cape of Good Hope, 276,966; Natal, 35,284; Transvaal, 110,450; Orange Free State, 49,647. Total population, according to the census of 1921, 6,928,580, distributed as follows: Cape of Good Hope, 2,782,719; Natal, 1,429,398; Transvaal, 2,087,636; Orange Free State, 628,827. The director of the census and statistics gave the estimated population in 1924 as 7,293,927. The principal cities with their populations according to the census of 1921 are: Johannesburg, 288,131; Cape Town, the seat of the legislature, 207,404; Durban, 146,310; Pretoria, 74,052; Port Elizabeth, 46,094; East London, 34,673. The capitals of the respective provinces are: Cape of Good Hope, Cape Town; Transvaal, Pretoria; Natal, Pietermaritzburg; Orange Free State, Bloemfontein. The movement of population in 1924 was: Births, 96,000; deaths, 59,984; marriages, 28,574. For a distribution of population by religions according to the census of 1921, see YEAR BOOK for 1924.

**EDUCATION.** The state schools and state-aided schools in 1923 numbered 4651, for whites, with 332,066 students; and 3312 for non-European scholars, with 263,738 scholars. The number of teachers for both groups, for primary, secondary, and intermediate schools only, was 21,000. In 1924 there were 286 private schools for white children, 372 for colored, with 20,490 white scholars, 16,892 colored scholars, and 1867 teachers. The largest universities in point of numbers, with their average enrollment at the end of 1924, were: University of Cape Town, 1526; University of Witwatersrand, 1154; Transvaal University College, 756; and the University of Stellenbosch, 711. The total number of students in the universities and colleges at the end of 1924 was 5213.

**AGRICULTURE.** Wheat and maize are the two leading agricultural products. In 1923-24 the production of wheat by provinces was as follows: Cape of Good Hope, 305,056,000 lbs.; Natal, 490,000 lbs.; Transvaal, 35,405,000 lbs.; Orange Free State, 13,747,000 lbs. The production

of maize in the entire Union in the same year was 1,666,426,000 lbs. Other products were: Barley, 50,154,450 lbs.; oats, 211,069,350 lbs.; kaffir corn, 246,032,200 lbs.; potatoes, 211,770,600 lbs.; and tobacco, 11,406,362 lbs. The 1924 census of livestock showed 9,606,274 cattle; 848,436 horses; 124,685 mules; 721,850 donkeys; 206,785 ostriches; 32,002,848 sheep; 8,063,754 goats; and 778,147 pigs. The production of wool in 1924 was 147,865,493 lbs., and of mohair, 8,099,094 lbs.

**MINERAL PRODUCTION.** According to *Engineering and Mining Journal*, the year 1926 witnessed a large expansion of mining operations in South Africa, and in most branches of the mineral industry there was a material increase in production. Estimates based on returns for the first nine months were that the value of the output of metals, minerals, and mineral products in the Union of South Africa would be about £57,372,000, compared with £54,478,000 for 1925. For the completed three-quarters of 1926 production in the four provinces was as given in the accompanying table:

MINERAL PRODUCTION FOR THE FIRST NINE MONTHS OF 1926

		Value in £
Gold .....	430,638 oz...	81,568,846
Silver .....	734,459 oz...	98,535
Osmiridium .....	4,806 oz...	79,571
Platinum .....	1,641 oz...	81,246
Diamonds .....	2,218,068 metric carats	7,447,628
Coal .....	10,063,630 tons..	2,968,902
Copper ore and concentrates .....	6,991 tons..	359,309
Tin, concentrates and metallic .....	1,380 tons..	288,193
Other minerals .....	.....	242,451

**MANUFACTURES.** In 1923-24 the value added to products by manufacture was £40,441,391, and the value of the gross production of the industries was £79,789,348. The total number of factories which made returns in that year was 7112; value of land and buildings, £20,965,920; machinery, plant, and tools, £30,432,143; materials used, £39,347,957; cost of fuel, light, and power, £3,326,947; average number of persons employed, 182,877 (whites, 66,189); wages paid, £20,505,206.

**COMMERCE.** The preliminary figures for South African trade in 1925 indicated that both exports and imports reached a highly satisfactory level. Exports for the year totaled £90,497,818 and imports £71,065,433, as against £82,107,968 and £67,705,076, respectively, in 1924. The outstanding feature of exports was the record movement of corn and corn meal, which, following

LEADING ITEMS IN SOUTH AFRICAN EXPORT TRADE

Commodity	1924	1925
Gold, including specie .....	£42,613,396	£43,328,375
Diamonds .....	7,133,370	8,605,528
Wattle bark .....	840,800	1,109,200
Coal .....	1,211,600	1,071,400
Ostrich feathers .....	353,200	204,000
Raw cotton .....	170,000	850,000
Corn and corn meal .....	878,700	6,489,200
Fresh fruit .....	484,700	729,900
Fresh meat .....	100,800	263,400
Sugar .....	178,700	766,900
Mohair .....	1,142,000	886,300
Hides and skins .....	3,196,900	2,870,800
Whale oil .....	264,700	471,100
Wool .....	15,768,900	15,095,446

the very heavy yield, advanced in value to £6,489,200 from £878,700 in 1924. Gains were also recorded in fresh fruits, meat, sugar, wattle bark, and cotton. Gold and gold concentrates declined, but the total exports of this metal, including that shipped in the form of specie, were slightly above the 1924 figure. A considerable drop occurred in exports of mohair and ostrich feathers, and a slight decline in wool shipments.

On the import side, a gain of nearly five per cent was registered, despite a drop from £8,302,600 in 1924 to £4,831,754 in 1925 in government stores purchased abroad. British manufactures maintained their relative position in the South African market; imports from the United Kingdom, excluding government stores, reached a value of £33,308,920 as against £30,806,287 in 1924, the ratio to total imports being 50.3 for both years. Purchases from other British possessions expanded from £7,330,691 in 1924 to £8,523,740 in 1925, and the relative proportion advanced from 12 per cent to 12.9 per cent. Imports from other countries showed a small gain in value, being £24,367,470 in 1925 as against £23,156,847 in 1924, but the percentage declined from 37.7 to 36.8 per cent.

**FINANCE.** The position of the South African treasury, as indicated near the close of 1926 by a published statement of revenues and expenditures for the first half of the fiscal year 1926-27, may be considered in the main as very satisfactory, although receipts were somewhat below estimates and disbursements slightly above.

The returns for the six months from all sources (exclusive of the loan account) totaled £11,827,000, which represents a gain of £787,000 over the corresponding period of 1925. The full year's estimates were placed at £26,814,000. However, with the bulk of the income tax falling due in the ensuing months, it was expected that the estimates would be fully realized if not substantially exceeded.

**REVENUE ESTIMATES OF THE SOUTH AFRICAN UNION FOR THE FISCAL YEAR 1926-27, WITH RECEIPTS DURING THE FIRST HALF OF THE YEAR**

Source	Estimated revenue for year ending Mar. 31, 1927	Receipts for 6 months ended Sept. 30, 1926
Customs .....	£7,710,000	£4,248,819
Excise .....	1,802,000	921,119
Posts, telegraphs, and telephones .....	3,430,000	1,576,748
Mining .....	1,630,000	947,461
Licenses .....	140,000	24,026
Stamp duties and fees .....	850,000	434,586
Income tax .....	6,647,000	1,209,889
Death duties .....	550,000	323,851
Native taxes .....	900,000	671,640
Interest .....	1,450,000	631,466
Miscellaneous .....	1,705,000	842,252
<b>Total .....</b>	<b>26,814,000</b>	<b>11,826,857</b>

The total disbursements for the six months were returned at £13,981,000, as against an estimated expenditure of £13,476,000. It was not likely that the second half would disclose quite so large an excess, owing to the fact that two items—interest on the public debt and the subsidies to provincial councils, which are unevenly distributed—will not be so heavily drawn upon during the second half of the fiscal year. The

increased pension voted and other items of appropriation, however, may be expected to bring the total for the year sufficiently in advance of the estimates to pare down materially the substantial budget surplus which otherwise would undoubtedly accrue.

Total revenue realized during the fiscal year 1925-26 amounted to £26,900,000, and expenditures charged against it totaled approximately £26,400,000, thus leaving an actual surplus of about £500,000. The public debt, which on Mar. 31, 1925, stood at £214,322,000, was increased by £26,600,000 in the course of the fiscal year. The sinking fund on hand amounted to the sum of £18,000,000.

**COMMUNICATIONS.** In 1924 the oversea shipping was as follows: Entered, 1293 vessels of 4,980,295 tons net; cleared, 1240 vessels of 4,737,717 tons. The South African Railways for the fiscal year ended Mar. 31, 1926, enjoyed a profitable year and showed new record totals for freight and passenger traffic. The total earnings amounted to £24,151,407, or £2,403,776 above those of the previous year, and after deducting operating expenditures the surplus available for interest and other net revenue charges amounted to £5,416,083 as compared with £4,889,060, leaving a net surplus of £769,691, which took care of the deficit in the previous year of £3185. The number of passengers carried was the highest in the history of the railways, amounting to 76,282,587. Freight traffic totaled 25,233,094 tons, not only the highest in the history of the railways, but an advance of 11 per cent over the previous year. The government-owned lines aggregated 12,002 miles, an addition of 524 miles to the system during the year. Since 1909, the year preceding the formation of the Union of South Africa, the mileage of the railways had increased by 84.08 per cent. The number of locomotives on Mar. 31, 1926, was 1935, an increase of 73 over the previous year; coaches, 3258, an increase of 84; freight cars, 34,770, an increase of 530. The mileage controlled by the Railways and Harbors Administration at the end of December, 1925, was 12,607. Of this total, 1352 miles represent Southwest African lines and 684 private undertakings leased and operated by the administration.

A number of African railway projects were approved by the British Foreign Office during the summer. Among these may be mentioned the £10,000,000 transport loan, of which Kenya and Uganda will be allotted £5,000,000 for harbor and railway improvements; and the Lobito-Katanga Railway, for which a stock loan of £1,150,000 was floated in London with the guaranty of the British government.

**GOVERNMENT.** The executive power is vested in the governor-general, appointed by the Crown, who acts through an executive council of ministers, each in charge of a department; and legislative power in a parliament, consisting of a senate of 40 members, of whom eight are appointed by the governor-general in council and 32 elected from the provinces (eight each); and a house of assembly of 135 members, distributed among the provinces as follows: Cape of Good Hope, 51; Transvaal, 50; Natal, 17; Orange Free State, 17; the basis of suffrage being the same as that existing in the province at the time of the formation of the Union. As a result of the elections of June, 1924, the assembly was constituted as follows: Nationalists, 63; South

African Party, 53; Labor, 18; Independent, 1; total 135.

The governor-general, commander-in-chief, and high commissioner for South Africa in 1926 was the Earl of Athlone; and the executive council was constituted as follows: Prime minister and minister of native affairs, Gen. J. B. M. Hertzog; interior, public health, and education, Dr. D. F. Malan; mines and industries, F. W. Beyers; railways and harbors, C. W. Malan; finance, N. C. Havenga; justice, Tielman J. Roos; defense, Col. F. H. P. Creswell; labor, T. Boydell; agriculture, Gen. J. C. G. Kemp; lands, P. G. W. Grobler; posts and telegraphs, W. Madely.

**HISTORY.** An interesting event occurred in the summer, when the South African government suggested the adoption of a national flag formed of red, green, yellow, and blue bars. The English element in the Union opposed the flag on the ground that there was no suggestion of the British flag in the color combination. To some extent this was offset by the provision that on state occasions the British flag was to be raised alongside the South African flag. The flag issue became a very bitter one, and resolved itself into a definite struggle between the Boers and the English, reminiscent of the struggle over the use of the Dutch language in the schools. The agitation over the native and Indian questions, which was noted in the preceding **YEAR BOOK**, continued throughout 1926, although no definite conclusion was reached on either subject by the government. The governments of India and South Africa agreed to talk over the entire matter conversationally before any action was taken.

Tremendous interest was taken in the British Imperial Conference, which is treated in the article **GREAT BRITAIN**.

When Premier Hertzog returned to South Africa he stated in a speech that he now believed that it was possible for English-speaking South Africans to be full citizens of South Africa and still hold a sense of loyalty to Great Britain. This seemed to many observers to be directly contradictory to his former attitude and not in accordance with the principles of his party, which aimed at separation from Great Britain. Other members of his party concurred in his views.

**SOUTH AMERICA.** See under the various South American countries; and under **NAVAL PROGRESS**.

**SOUTH AUSTRALIA.** One of the states of the Australian Commonwealth, comprising the central and southern part of the island continent; bounded by the Northern Territory on the north, by Western Australia on the west, and on the east by Victoria, New South Wales and Queensland. Area, 380,070 square miles; population, according to the census of 1921, 495,336; estimated on June 30, 1925, 543,122, exclusive of aborigines, of whom the number is unknown. The number of full-blooded natives living in the settled portions has been estimated at only 1609. Capital and largest city, Adelaide, with a population (including suburbs), in 1924, of 289,914. In 1924 the movement of population was: Births, 11,592; deaths, 4870; marriages, 4121.

Education is secular, free, and compulsory. In 1924 there were 1078 schools with 83,483 pupils under instruction; private schools numbered 186, with 15,063 pupils. For higher education there is the University of Adelaide, and

there are various institutions for the training of teachers and for technical instruction. In 1924-25 the principal crops, with their acreage and production, were as follows: Wheat, 2,499,852 acres, 30,528,625 bushels; barley, 166,432 acres, 3,103,718 bushels; oats, 155,214 acres, 1,939,415 bushels; hay, 562,253 acres, 716,749 tons; vines produced 10,502,381 gallons of wine. The chief mineral products are gold, copper, ironstone flux, and gypsum. The total value of the mineral production in 1924 was £953,238. The imports for 1924-25 amounted to £13,978,296 and the exports £19,208,657. The chief exports are wool, wheat, copper and other minerals, meats, butter, wine, honey, fruits, hides and skins, tallow, leather, and manures. The revenue for 1926 was £10,473,924, and the expenditure £10,461,081. The revenue is largely derived from inland sources—railways and territorial receipts—and the chief items of expenditure are public service, railways, and the service on the public debt, which amounted to £72,481,942 on June 30, 1925.

In 1924-25, 1280 vessels of 4,573,822 tons entered the ports of South Australia. In 1925 there were 3400 miles of railways in the state. A comprehensive programme of railway construction was proposed in South Australia for 1927. Surveys for the North-South Railway from Oodnadatta to Alice Springs would be completed by the end of 1926, it was expected, and operation of the line was to commence in January, 1927. It was proposed to construct the first 25 miles by departmental labor, and tenders were to be asked for the work beyond M. P. 25, early in 1927. The proposed railway from Port Augusta to Red Hill will also be undertaken at the beginning of 1927, when a bill for appropriations will be submitted to parliament.

The administration is under a governor appointed by the Crown, with an executive council; legislative power is vested in a council and an assembly, the latter consisting of 46 members elected for three years. Governor in 1926, Maj.-Gen. Sir George Tom Molesworth Bridges; prime minister, treasurer, and minister of railways, J. Gunn.

**SOUTH CAROLINA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,683,724. The estimated population on July 1, 1926 was 1,826,000. The capital is Columbia.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1926	2,732,000	1,080,000 *	
	1925	2,802,000	888,666 *	
Corn	1926	1,426,000	22,103,000	\$19,898,000
	1925	1,584,000	19,483,000	21,431,000
Tobacco	1926	81,000	57,510,000 *	13,400,000
	1925	96,000	71,040,000 *	12,077,000
Oats	1926	416,000	10,483,000	7,024,000
	1925	378,000	7,182,000	6,464,000
Potatoes	1926	29,000	3,219,000	5,472,000
	1925	25,000	2,400,000	5,040,000
Sweet potatoes	1926	52,000	4,160,000	4,160,000
	1925	52,000	2,860,000	4,204,000
Hay, tame	1926	260,000	202,000 *	4,040,000
	1925	214,000	57,000 *	1,140,000
Wheat, winter	1926	50,000	800,000	1,240,000
	1925	46,000	506,000	986,000

\* bales, \* pounds, \* tons.

**MINERAL PRODUCTION.** Most important of the mineral products of the State are stone and clay

products, which with sand and gravel make up almost the totality of the value of the yearly output. Clay products had a value of \$1,511,154 in 1924 and in 1923 of \$1,448,790. Of stone there were produced 824,030 short tons in 1924 and in 1923, 847,070 short tons; in value \$1,527,114 in 1924 and in 1923, \$1,657,926. The total value of the mineral products of the State was \$3,444,366 in 1924; in 1923, \$3,550,059.

**FINANCE.** As summarized by the United States Department of Commerce, payments for maintenance and operation of the general departments of the State for the fiscal year ending Dec. 31, 1925, were \$11,885,257. Their per capita rate was \$6.68, as against \$5.26 in 1924 and \$1.82 in 1917. Their total included \$3,411,421 for education, apportioned among minor State divisions. Payments amounting to \$331,774 for interest on debt and \$4,152,129 for permanent improvements, added to the payments for maintenance and operation of departments, made the year's total of State payments \$16,369,160. For highways was expended the sum of \$5,644,502, of which \$2,116,986 was for maintenance and \$3,527,516 for construction.

Revenue receipts of the State were \$16,970,030, or \$9.54 per capita. They exceeded by \$4,752,999 the total payments except those for permanent improvements, and furthermore, exceeded by \$600,870 the total with these included. This excess increased the State's cash balances. Property and special taxes formed 33.5 per cent of the revenue in 1925, as against 45.3 per cent in 1924 and 64.4 per cent in 1917. Their per capita rate was \$3.19 in 1925, \$3.07 in 1924 and \$1.24 in 1917. Earnings of the departments and compensation for officials' services furnished 7.2 per cent of the 1925 revenue; business and non-business licenses, 46.8 per cent. License revenue was increased in 1925 by a tax on non-alcoholic drinks, by a higher tax on gasoline and by the crediting to the State of the entire tax on motor vehicles. License receipts included also the proceeds of taxes on incorporated companies and on sales of tobacco, cigars, and cigarettes.

The net indebtedness of the State, Dec. 31, 1925, was \$5,280,915, or \$2.97 per capita, as against a per capita of \$2.96 in 1924 and \$3.32 in 1917. The assessed valuation of property subject to State tax was \$430,082,368. The State tax levy was \$3,018,137, or \$1.70 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 3748. There was constructed in 1926 two miles of new second track.

**EDUCATION.** The tendency away from the smaller and less effective types of rural school was marked by a diminution in the number of such schools in the course of the year. Of rural schools having 1, 2, or 3 classrooms, the number was reported as having declined from 1468 to 1314. The total number of white schools fell from 2100 to 1921, according to the State supervisor of rural schools. There were established 31 rural white high schools. Third-grade certificates were abolished and second-grade certificates discontinued, the latter having previously been granted on high school diplomas and summer school additional credits. A State measure guaranteeing a term of seven months to schools attaining a required standard went into effect. For negroes, 66 Rosenwald schools and 8 teacher-training schools were established. In the school year 1925-1926, the number of public

schools was officially given as white, 1921; negro, 2385. There were enrolled 248,562 white pupils and 234,707 colored, the total enrollment being, for both races combined, 483,269. Expenditures of all sorts for the schools totaled for the year \$16,329,372. Salaries of teachers averaged, for whites, \$982; and for negroes, \$309.

**CHARITIES AND CORRECTIONS.** The State Board of Public Welfare was established in 1920, succeeding the Board of Charities and Corrections and the Board of Correctional Administration. The Governor of the State is chairman ex officio. Six members with six-year terms, one term expiring every year, complete the board. The population of the State institutions for the year was approximately: South Carolina Industrial School for Girls (white), 60; South Carolina Industrial School for Boys (white), 170; State Reformatory for Negro Boys, 102; State Training School (for the feeble-minded), 330.

**POLITICAL AND OTHER EVENTS.** At the general election, November 2, John D. Richards was elected Governor for the four-year term beginning January, 1927, and Senator Ellison D. Smith was reelected to the United States Senate to serve the six-year term. Both ran as Democrats, without Republican opposition. Seven Democratic candidates were elected to the United States House of Representatives, all being the holders of the seats. The other chief State officers elected in November, to take office in 1927, were Lieutenant-Governor, Thomas B. Butler; Secretary of State, W. P. Blackwell; State Treasurer, J. H. Scarborough; Budget Clerk, G. L. Weissinger; Attorney-General, John M. Daniel.

A close contest took place in the summer, in the primaries of the dominant State Democratic party. Senator Ellison D. Smith, as candidate for the nomination for United States Senator, was opposed by Speaker Edgar A. Brown, and failed to gain the prescribed majority. This outcome necessitated a run-off primary, which was held September 14 giving Smith the nomination. A proposed amendment to the State constitution, to lengthen the terms of representatives in the General Assembly from two to four years, was defeated at the regular November election by a vote of decisive proportions, being about two adverse to one in favor. Only about 9000 votes were cast.

**OFFICERS.** Governor, J. G. McLeod; Lieutenant-Governor, E. B. Jackson; Secretary of State, W. P. Blackwell; Treasurer, S. T. Carter; Budget Secretary, Ben W. Sawyer; Attorney-General, John M. Daniel.

**JUDICIARY.** Chief Justice: Eugene B. Gary; Associate Justices: Richard C. Watts, Thomas B. Fraser, Thomas P. Cothern, J. Hardin Marion.

**SOUTH CAROLINA, UNIVERSITY OF.** A non-sectarian State institution of higher education at Columbia, S. C.; founded in 1801. The enrollment for the fall term of 1926 was 1444, consisting of 1011 men and 433 women. There were 461 students registered for the summer school. The faculty numbered 87, including instructors. The productive funds of the University were \$528,903.25. There were 80,000 volumes in the library. A new president, Davison McDowell Douglas, A.M., D.D., LL.D., formerly president of the Presbyterian College of South Carolina, was installed, following the death of William Davis Melton, LL.D. (q.v.).

**SOUTH DAKOTA. POPULATION.** The fourth State census of South Dakota was taken as of

May 1, 1925, and showed a total population of 681,260, of which 20,559 were Indians. Of this total 347,579 were males and 313,122 were females. This indicated an increase in population over that shown by the Fourteenth Census of the United States, which returned for South Dakota 636,547 on Jan. 1, 1920. The estimated population on July 1, 1926, was 689,000. The capital is Pierre.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	4,433,000	79,794,000	\$46,281,000
	1925	4,478,000	78,865,000	47,019,000
Wheat,	1926	75,000	525,000	604,000
	winter	1925	125,000	1,438,000
Wheat,	1926	1,842,000	10,315,000	12,172,000
	spring	1925	2,576,000	38,908,000
Oats	1926	1,984,000	28,218,000	8,357,000
	1925	2,884,000	96,856,000	26,980,000
Hay, tame	1926	1,361,000	1,864,000	17,732,000
	1925	1,095,000	1,452,000	15,972,000
Barley	1926	778,000	7,858,000	4,086,000
	1925	915,000	23,790,000	11,181,000
Flaxseed	1926	475,000	2,755,000	5,234,000
	1925	559,000	3,801,000	8,552,000
Potatoes	1926	55,000	3,800,000	5,247,000
	1925	61,000	3,965,000	7,137,000

\* tons.

**MINERAL PRODUCTION.** The State is one of the chief producers of gold, which in turn forms by far the largest part of its mineral product in point of value. The Homestake mine, the most productive in the United States, is situated in the State. The State's gold mines produced 288,160 troy ounces of gold in 1925, and 297,085 troy ounces in 1924; in value, \$5,956,800 in 1925 and in 1924, \$6,141,300. Silver in minor quantity was produced; in 1925, 98,234 troy ounces and in 1924, 89,417 ounces; with a value for 1925 of \$68,174, and for 1924 of \$59,909. Stone, sand and gravel, and coal also were produced. The total value of the State's mineral production was in 1924, \$6,884,433; in 1923, \$7,372,368. In 1926, the Homestake mine produced approximately \$5,794,000 in gold and 82,000 ounces of silver, according to the U. S. Bureau of Mines. In 1926, the Homestake also produced tungsten concentrate. Development work was done at small mines near Keystone, S. D.

**FINANCE.** As summarized by the Department of Commerce of the United States, payments for maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$7,578,122. Their rate per capita was \$11.17, as against \$10.44 in 1924 and \$5.90 in 1918. Their total included \$1,715,335 for education, apportioned among minor State divisions. Payments amounting to \$723,824 for public-service enterprises, \$3,208,369 for interest on debt and \$6,328,236 for permanent improvements, added to the payments for maintenance and operation of departments, made the year's total of State payments \$17,838,551. For highways was expended the sum of \$6,208,897, of which \$804,471 was for maintenance and \$5,404,426 for construction.

Revenue receipts of the State were \$15,910,115, or \$23.45 per capita. They exceeded by \$4,399,800 the total payments except those for permanent improvements, and were \$1,928,436 less than the total with these included. Payments in excess of revenue were met from the proceeds of bond obligations. Property and special taxes

formed 27 per cent of the revenue in 1925, as against 27.3 per cent in 1924 and 36.9 per cent in 1918. Their per capita rate was \$6.32 in 1925, \$5.76 in 1924 and \$3.06 in 1918. Earnings of the departments and compensation for officials' services furnished 7.8 per cent of the 1925 revenue; business and non-business licenses, 20.2 per cent. License revenue was derived chiefly from taxes on incorporated companies, on sales of gasoline and on motor vehicles.

The net indebtedness of the State on June 30, 1925, was \$15,965,111, or \$23.53 per capita, as against a per capita of \$25.18 in 1924 and none in 1918. The assessed valuation of property subject to State tax was \$1,876,112,767. The State tax levy was \$4,428,250, or \$6.53 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 4245. There was no new construction and no abandonment of line was reported in 1926.

**EDUCATION.** Requirements for qualification of teachers were raised. Applications of those having passed the high school normal training course and seeking second-grade certificates were granted only after examination. In the school year ending June 30, 1926, the school population was estimated as 208,017. Enrollment in the public schools was 164,561, there being 138,166 enrolled in the common schools and 26,395 in the high schools. Expenditures for public education in the year amounted to \$18,436,263. Salaries of teachers averaged \$1210 a year.

**CHARITIES AND CORRECTIONS.** A Board of Charities and Corrections, having chief charge of welfare and correctional activities, publishes a biennial report. The State institutions include the State Penitentiary, the South Dakota School for the Deaf, the School for the Blind and Training School, the State School for the Feeble-Minded, the State Hospital, and the Soldiers' Home.

**POLITICAL AND OTHER EVENTS.** At the general election, November 2, W. J. Bulow, the Democratic candidate, was elected Governor for the two-year term beginning January, 1927. He was the first Democrat to win the office. His opponent, Governor Carl Gunderson, obtained the Republican nomination, but was defeated largely through the opposition of a portion of his own party. Governor Gunderson drew this opposition on himself by efforts made in the course of his term to terminate the State rural credit system under which the State had advanced some \$47,500,000 to farmers and land holders. Bulow engaged himself, in his campaign, to support the State bank guarantee law, the repeal of which had been sought after the failure of a number of banks in the State had rendered the State liable to depositors for some \$25,000,000. Senator Peter Norbeck, Republican, was reelected to the U. S. Senate, and the three Republican members of the U. S. House of Representatives were likewise reelected.

Other State officers elected in November were: Lieutenant-Governor, H. E. Covey; Secretary of State, Gladys Pyle; Treasurer, A. J. Moodie; Auditor, E. A. Jones; Attorney-General, Buell F. Jones.

**OFFICERS.** Governor, Carl Gunderson; Lieutenant-Governor, A. C. Forney; Secretary of State, F. C. Coyne; Treasurer, J. L. Driscoll; Auditor, E. A. Jones; Attorney-General, Buell F. Jones.

**JUDICIARY.** Supreme Court: John Howard

Gates, Samuel C. Polley, Frank Anderson, C. G. Sherwood, Charles Hall Dillon.

**SOUTH DAKOTA, UNIVERSITY OF.** A State institution of higher education at Vermilion, S. D.; founded in 1882. The enrollment for the first semester of 1926 was 1101, and 224 were registered for the summer session of 1926. The faculty and staff numbered 135. The productive funds amounted to \$412,950, and the income for the year was \$75,000. The library contained 60,000 volumes. President, Robert L. Slagle, Ph.D., LL.D.

**SOUTH DAKOTA STATE COLLEGE.** A State college of agriculture and the mechanic arts at Brookings, S. D.; founded in 1882. The enrollment for the autumn of 1926 was 1087, of whom 23 were graduate students. The 1926 summer session had an enrollment of 176. The faculty, inclusive of the extension staff, numbered 140, of whom 24 were appointed during the year. The income for the year, including that from 160,000 acres of land, amounted to \$889,549.84. The library contained 35,000 bound volumes, and about 12,000 pamphlets. A new library building, to cost \$200,000, was in course of erection, and was expected to be completed by July 1, 1927. President, Charles W. Pugsley, B.S., D.Agr.

**SOUTHERN CALIFORNIA, UNIVERSITY OF.** A co-educational institution of higher education at Los Angeles, Calif.; founded in 1879. It comprises the following schools and colleges: Liberal Arts, Music, Dentistry, Pharmacy, Metropolitan, Graduate, Religion, Law, Speech, Commerce and Business Administration, Education, Social Welfare, and Architecture. The enrollment for 1925-26, including summer session and extension classes, was 12,217. For the summer session of 1926 the enrollment was 4008. In the autumn of 1926 there were 500 members on the faculty. The endowment was \$500,000, the income from tuition fees \$1,116,023.64, and other income \$134,502.87. There were 85,000 volumes in the library. The following buildings were erected during the years 1924-26: Women's Residence Hall, Law School building, Science building, and School of Architecture building. President, Rufus B. von Kleinsmid, Sc.D., J.D.

**SOUTHWEST AFRICA.** A former German protectorate, administered since Dec. 17, 1920, by the Union of South Africa under a mandate from the League of Nations; bounded on the north by Portuguese West Africa, on the west by the Atlantic Ocean, and on the south and southeast by the Cape of Good Hope Province of the Union, and on the remainder of the eastern boundary by the Bechuanaland Protectorate. Capital, Windhoek, with a population of 4196 Europeans and 13,160 natives; area, 311,820 square miles; population, according to the census of 1921, 19,432 Europeans (7855 Germans) and about 209,300 natives. The non-German element in the European population is almost entirely South African. The chief native tribes are Hottentots, Bushmen, Hereros, Ovambos, and Bergdamarus.

In 1925 there were 41 government schools with 2585 pupils, and 16 registered private schools with 600 pupils, for the education of the white children; for the natives there were in the same year 44 government-aided mission schools with 2700 pupils, and 12 mission schools not yet aided. Stock raising is the principal pursuit; agriculture has been found impractical on a large scale because of the scarcity of water.

The principal mineral product is diamonds; others are copper, vanadium, marble, tin, gold, and silver. Imports from overseas in 1924 were £628,026; from the Union of South Africa, £1,071,606; exports overseas £2,241,308, to the Union of South Africa, £606,305. The estimates for 1925-26 were: Revenue, £652,115; expenditure, £832,363. There are about 1333 miles of government-owned railway and 98 miles of privately owned lines. The head of the government is an administrator representing the governor-general of the Union of South Africa; he has full power to legislate and is assisted by an advisory council. Administrator, A. J. Werth, appointed in November, 1925. See SOUTH AFRICA, UNION OF.

**SOVIET SOCIALIST REPUBLICS OF RUSSIA.** See RUSSIA.

**SPAIN.** A constitutional monarchy of southwestern Europe, occupying the greater part of the Iberian peninsula and separated from France by the Pyrenees. Capital, Madrid.

**AREA AND POPULATION.** Continental Spain has an area of 190,050 square miles; including the Balearic and Canary Islands and the Spanish possessions on the north and west coasts of Africa, the area is 194,800 square miles. According to the census of 1920, the population was 21,959,086, as compared with 19,950,817 in 1910; estimated, Dec. 31, 1924, 21,966,641. The cities with over 150,000 inhabitants on Dec. 31, 1924, were as follows: Madrid, 783,216; Barcelona, 738,498; Valencia, 260,329; Seville, 210,949, and Malaga, 156,513. The movement of population in 1924 was: Births, 649,615; deaths, 430,474; marriages, 158,316.

**EDUCATION.** On Jan. 1, 1924, there were 29,622 public schools and about 5600 private schools, the total number of pupils being 3,128,064. There were 58 secondary schools with 57,579 pupils. There are eleven universities, situated at Barcelona, Madrid, Granada, Murcia, Oviedo, San Diego, Salamanca, Seville, Valencia, Valladolid, and Zaragoza. In 1924 these universities were attended by 25,690 pupils. At Cadiz there is a medical faculty affiliated with the University of Seville, which also maintains an educational institution in the Canary Islands.

**PRODUCTION.** The following table from the *Statesman's Year Book* for 1926 shows the area under the principal crops and the yield for 1925:

	Area 1925 Acres	Yield 1925 Cwt.
Wheat .....	10,717,760	88,501,420
Barley .....	4,411,953	43,077,260
Oats .....	1,797,654	12,611,678
Rye .....	1,845,253	15,179,894
Maize .....	1,169,819	14,331,184
Millet .....	4,900	42,896
Mealin .....	112,158	595,448
Rice .....	120,289	6,119,392
Beans .....	532,670	3,859,330
Kidney beans .....	707,939	3,882,210
Peas .....	143,391	802,992
Chick peas .....	628,247	3,257,156
Lentils .....	86,242	668,866
Tares .....	489,495	2,718,832
Vetches .....	172,211	1,372,984

For a survey of the national wealth of Spain see the preceding YEAR BOOK under the heading *Production* in the article on Spain.

**COMMERCE.** Spanish foreign trade in 1925 showed declines in both import and export categories, as compared with the previous year. Imports reached only 2,250,000,000 pesetas as

against 2,947,000,000 pesetas in the earlier year, while exports amounted to 1,581,000,000 pesetas as against 1,790,000,000 pesetas. The decline in the case of exportation was less important, and the heavy unfavorable balance was thus reduced. Exportation of manufactured articles showed an increase to 456,000,000 pesetas for the year, as against 400,000,000 pesetas in 1924, and there was a striking decline in importation of unmanufactured goods.

Trade continued to show improvement during the first six months of 1926. Both export and import trade were larger than for the corresponding periods of the two previous years, and the unfavorable balance was considerably reduced.

Of the major imports, raw materials alone showed a decrease from 1925. The decline in exports of raw materials and of manufactured articles was offset by the large gain in exports of foodstuffs, which was sufficiently great to reduce the unfavorable balance for the period.

**FINANCE.** The revenue budget for 1925-26 is fundamentally a prorogation of that for the previous year. A net reduction of 22,500,000 pesetas, distributed over direct taxes, indirect taxes, and income from state property, was the only outstanding feature.

**SPANISH BUDGETS**  
(In thousand pesetas, paper)

Classification	1924-25 * estimated	1925-26 estimated
<b>Expenditures</b>		
General obligations:		
Royal household .....	9,500	9,500
Senate and deputies .....	2,084	2,056

<b>Deficit .....</b>	<b>163,884</b>	<b>337,249</b>

\* Owing to a change in the opening date of the fiscal period (effective in 1924), by which the year begins on July 1 instead of April 1, the interim period (Apr. 1-June 30) was conducted under an extension of the previous year's budget.

An extraordinary budget authorizing expenditures in the various departments of the Spanish government during the next 10½ years was adopted by a royal decree dated July 9, 1926. It was intended to spend between that date and Dec. 31, 1936, the sum of 3,538,947,550 pesetas. The decree provided that the sums appropriated shall be obtained from the sale of public bonds to be issued during each fiscal year, to an amount equivalent to the credits authorized for that year. Of the total of the extraordinary expenditures authorized, nearly one-half is allotted to the ministry of public works, divided as follows: Port works, 600,000,000 pesetas; hydraulic works, 100,000,000; highway circuit around Spain, 600,000,000; road construction in general, 200,000,000; and reforestation, 100,000,000 pesetas.

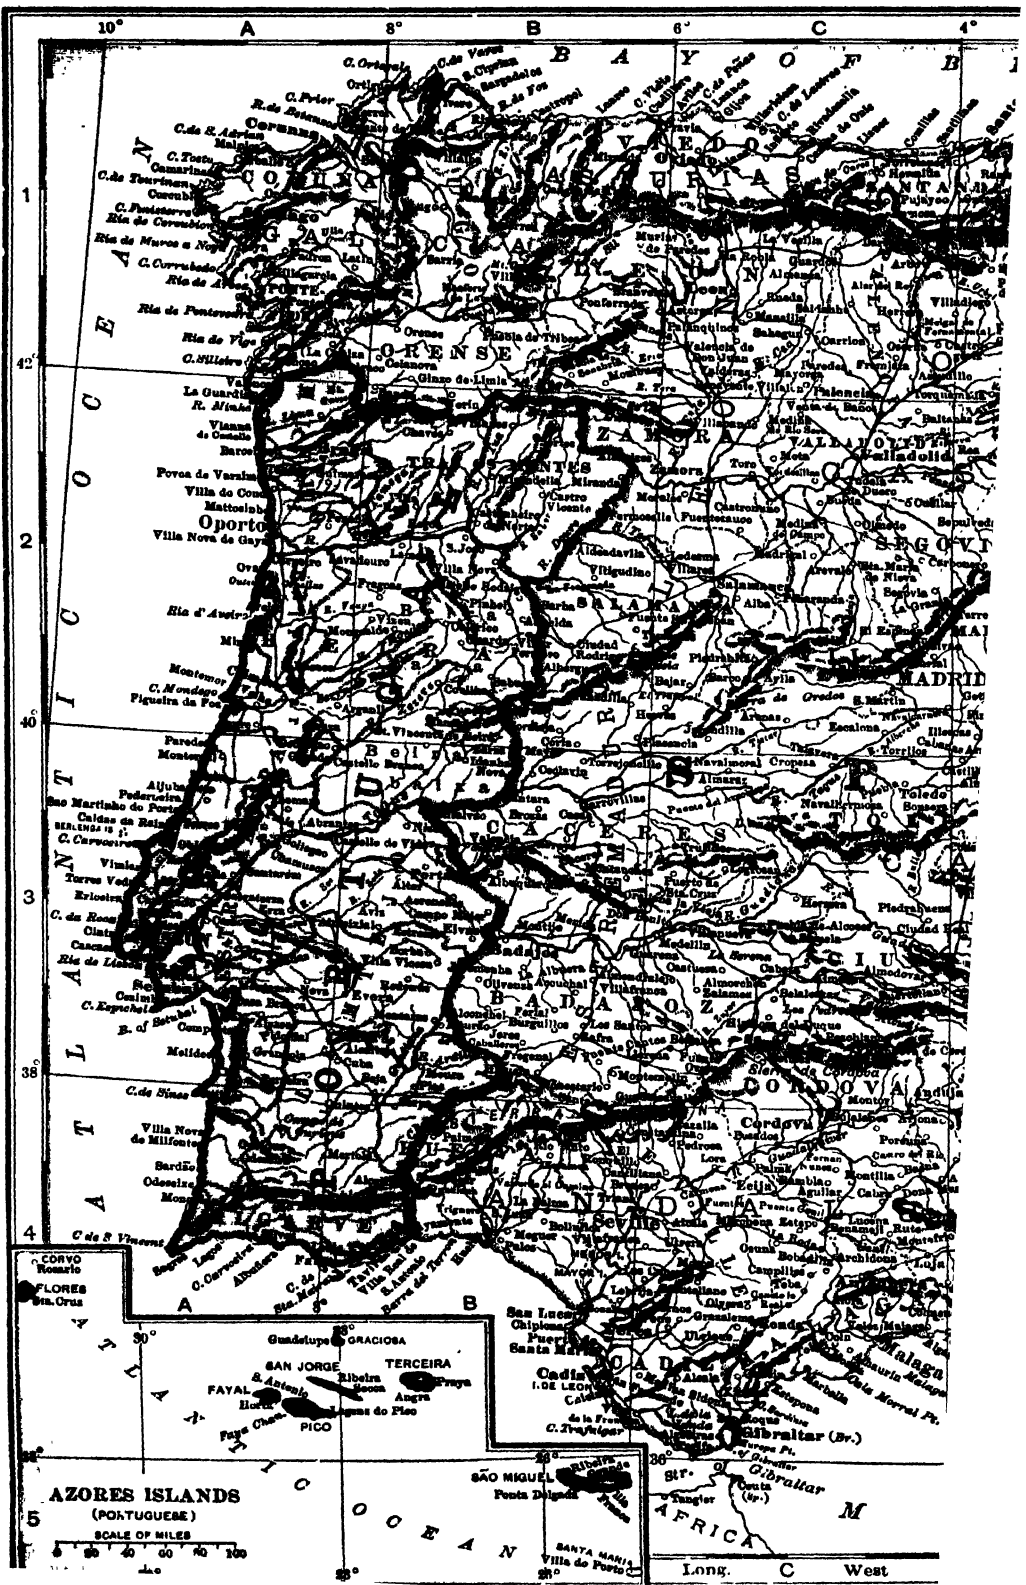

**COMMUNICATIONS.** The merchant navy on Jan. 1, 1925, contained 1221 steamers of 1,189,108 tons net.

The three principal Spanish railways enjoyed a less favorable financial position during 1925 than in 1924. In the autumn, the Northern purchased the Central of Aragon. Considerable interest in the sale took place in railway circles, since it is the first move of any regrouping under the new railway "regimen," and was said to be free from any influence or pressure on the part of the government. The Central of Aragon was owned by Belgian interests, and is one of the most prosperous railroads in Spain; in fact, it is the only railway of importance which has been able to operate under the railway law of 1924 without any financial aid or increase in rates. The line, nearly all single track of 4 ft. 6 in. gauge, runs from the port of Valencia into the centre of Aragon, for a distance of about 186 miles. The purchase price was given as 57,000,000 pesetas.

The supreme railway council of Spain, on April 27, gave its technical approval to the immediate construction of the following railway lines authorized April 23 by the council of ministers: Madrid to Burgos, a distance of approximately 250 kilometers; Cuenca to Utiel, 200 kilometers; Jerez to Sentenil, 125 kilometers; Soria to Castejon, 125 kilometers; Puertollano to Cordoba, 120 kilometers; Teruel to Alcaniz, 200 kilometers; and Alcaniz to Caspe, 25 kilometers.

Construction work on a number of railway projects in different regions of Spain, together with the filing of orders for rolling stock, was definitely ordered on Dec. 3, 1926. In Coruña Province, northwestern Spain, immediate construction was ordered for a 43-kilometer branch connecting Ferrol with Betanzos on the Zamora-Orense-Coruña Railway. This branch, the only state-owned railway in the system, will provide rail transportation (via Betanzos) between Ferrol, the base of a naval arsenal, and the seaport of Coruña just to the south. In the Andalusian region, southern Spain, construction was authorized on a 160-kilometer line between Baeza, in Jaen Province and Alcaez, in Albacete Province. This new line, to follow the course of the Guadalquivir River, will constitute the first section of the projected Baeza-Utiel Railway, which will unite the Andalusian region with the Mediterranean coast at Valencia without the necessity of passing through Madrid. The Baeza-Utiel line will be complementary to the projected Utiel-Teruel-Lerida line in northeastern Spain

and will constitute a part of the secondary services of the state, connecting the Andalusian region with the Catalanian region.

**GOVERNMENT.** Executive power is vested in the King, who, according to the constitution, acts through a responsible ministry; and legislative power in the Cortes, or parliament, consisting of a senate and a chamber of deputies. Parliament was dissolved by a royal decree, Sept. 16, 1923. The King in 1926 was Alfonso XIII, who succeeded on his birth (which occurred after his father's death), May 17, 1886. Under the constitution the principle of ministerial responsibility is established, but in 1923 a directorate was set up under Lieut.-Gen. Primo de Rivera. On Dec. 3, 1925, the military directorate was superseded by a civil government, under the presidency of General Primo de Rivera, and composed of members of the new political party, the "Unión Patriótica." All the former ministry departments were reestablished. The change was one in name only, as everything continued as before, when Rivera managed things alone. The new civil government was constituted as follows: President of the council, Primo de Rivera; foreign affairs, Señor Yanguas; justice and worship, Señor Galo Ponte; war, Duke of Tetuán; marine, Vice-Admiral Cornejo; finance, Señor Calvo Sotelo; interior, Gen. Martínez Anido; public instruction, Señor Callejo; public works, Señor Benjumea; labor, Señor Aunós.

**HISTORY.** The Rifian War came to a close on May 26 with the Surrender to the Spanish and French forces of Abd-el-Krim. See **MILITARY PROGRESS AND MOROCCO.**

The Directorate. As announced in the preceding **YEAR BOOK**, a change in the form of government took place towards the close of 1925. In a sense, it was a return to constitutional civil government, but from the practical point of view it was the old military government under a new name. Everything went on as before, with the cabinet decreeing the laws and no parliament in session. Early in 1926, Primo de Rivera reiterated again and again that there would be no change in the form of government as it then existed, and he was reported as saying that no parliament would meet for at least four years. He said: "The permanence of the government is for an indefinite time, since the country desires no political changes. For the next ten months there cannot be any talk of collective assemblies or other constitutional changes, which will happen only after all other more urgent problems have been solved." The Catalanian problem continued to be troublesome to Primo de Rivera. His attempts to enforce the use of the Spanish language on the people of Catalonia was met with stout resistance, and resulted in press censorship as far as Catalonia was concerned, as well as in prison terms for the extremists of the separatist movement. The government went so far as to threaten confiscation of property and loss of the right to practice professions if the Catalonians persisted in using their own language and refused to obey the dictates of the government.

During June a plot was unearthed to overthrow the government of the Spanish dictator. The leaders in the movement were General Weyler, former chief of the general staff, and General Francisco Aguilera, former minister of war. The plot was discovered the day before it was to be executed, and the government took prompt and severe measures to arrest the leaders. About 400

in all, of various political opinions and beliefs, were arrested. Many of the higher officers in the army were implicated. Apparently, the movement was completely checked by the end of the first week in July, when the government announced that heavy fines and imprisonments would be imposed upon the leaders of the movement. According to literature seized, the purpose of the revolutionary scheme was to restore to Spain the form of government which was in vogue before Rivera's coup of Sept. 13, 1923. Although order was restored, according to government announcements, enough news filtered through the strict censorship to let the outside world know that all was not well within the country and that the army was, time and again, on the point of mutiny. With the consummate skill of the seasoned politician, Rivera determined to offset the obvious dissatisfaction with his rule by holding a plebiscite on September 11, 12, and 13, to see whether the people were for or against him and his plans of government. Of course, the result was known before the first ballot was cast. According to the official reports, almost 7,000,000 people voted for Rivera and his schemes. No negative votes were allowed and, in order to roll up a huge majority, all sorts of changes were made in the former electoral laws. Some critics stated that whole classes of school children were marched to the polls to cast a solid vote of approbation for the dictator. The year closed with the situation unchanged so far as Rivera was concerned. Undoubtedly, there was unrest, but not a sufficient amount of it to cause the government any uneasiness or to make it feel that it would soon be necessary to grant reforms or else face ruin.

For the relations of Spain with the League of Nations, see **LEAGUE OF NATIONS.**

**SPANISH LITERATURE.** Again in 1926, as in the two previous years, the output in the drama seems to have outstripped those of the other branches, while fiction has forged ahead of erudition.

**DRAMA.** Benavente gave *La Mariposa que Voló sobre el Mar*, a delicate comedy that proved to be an enormous success. L. Fernández Ardavin produced *Rosa de Madrid*, a beautiful play devoted to the Madrid that is fast disappearing. The Álvarez Quintero brothers continued to delight the nation. We note particularly *Las de Abel* (presenting a problem the reverse of their earlier and successful *Las de Caín*), *Los grandes hombres, o el monumento a Cervantes* (a loa), and *Barro pecador* (one of their best). P. Mafioz Seca again ran true to form, whether writing alone as in *Humo* (dialogue between an author and an actor facing the cruelties of life and admitting that "the glories of life are smoke"), and *La venganza de Don Mendo* (caricature of a tragedy, and one of his greatest successes), or collaborating with Pérez Fernández as in *María Fernández* and *La cabalgata de los Reyes* (a new step of these authors away from mere rollicking comedy to something a bit more serious and promising much for their future in this field). Fernández del Villar's *La Prudencia* is considered his best work to date. E. Thuillier and J. López de la Hera won a triumph with *La mujer que necesito*. G. Martínez Sierra, with Honorio Maura, produced the delightful comedy *Mary, la insoportable*, a step forward in the collaboration of these two authors; and, with Eduardo Marquina, the beautiful poetic comedy, *El*

*camino de la felicidad* (story of an abandoned young girl going through life without other protection than her simplicity, and without other hope than a dream that she dreams and follows until her dream comes true). Pilar Millán Astray won favor especially with the sainete, *Magda, la tirana*, which was a veritable triumph. The Machado brothers, Manuel and Antonio, wrote a beautiful tragi-comedy in verse, *Desdichas de la fortuna, o Julianillo Valoórcel*, dealing with the times of the Count-Duke of Olivares. Luis Manzano established his reputation with *Doña Tufitos*. The novelist, Rafael López de Haro, won new dramatic laurels with *Ser, o no ser*, and *En qué consiste el honor*. Miguel A. Oliva, working with Javier de Buróos, produced a religious play *La tragedia de Gólgota*, artistically built up from biblical texts. Federico Oliver registered two very great successes, *El azar* and *Lo que ellas quieren*. Felipe Sassone presented successfully *Todo tu Amor . . . o si no es verdad debiera serlo*, and *Y después?* Julián Sánchez-Prieto, the Castilian shepherd-poet, discovered in 1923, had a riotous success with *Al escampio!*, which he calls merely a "dramatic skit."

The following may also be noted: J. I. Luca de Tena, *La opinión de los Demás* (his best play); Grajales and Gómez de Miguel, *El Mártir del Calvario* (worthy revival of an obsolete genre: the *auto sacramental*); Tomás Luceño (the eighty-one year old veteran adapter of Lope, Tirso, and Rojas), *El imposible mayor* (exquisite verse, very much in seventeenth-century style, and a veritable gem); Joaquín Montañer, *El loco de Extremadura* (deals with the journey of Charles V to retirement at Yuste, is very dramatic, historically accurate, and couched in fluid, sober verse, suited to the subject); Manuel Abril, *Pero . . . ¡ Si yo soy un hermano!* (subtle, hilarious farce); Miguel de Unamuno, *Raquel* (a drama); L. Capdevila and C. Giralt, *El ídolo de carne* (strong study of passion, very well received); Enrique Suárez de Deza, *Aventura* (surpassed his last year's triumph, *La dama salvaje*); Serrano Anguita, *La Pájara* (a real masterpiece); and Carlos Arniches, *El último mono*.

We have been favored with an unusual number of new dramatists of promise, some unheard of, others known in other fields: Martín Galeano and López Carrión, *La sombra de Hamlet* (very successful); Claudio de la Torre, *Un héroe contemporáneo*; Miguel Urriós, *Estaba un día un pastor* (tragic scenes inspired by verses of an old ballad); Pilar Algorta de Dupóns, *Sin gloria y sin amor* (enormous success); and Azorín, *Old Spain* (a beautiful combination of classicism and modernism).

FICTION. This year fiction, although still behind drama, ran ahead of erudition. The following works are the most noteworthy: J. Lillo Rodelgo, *Clara Angélica* (awarded the 3000-peseta prize of the *Magisterio Español* contest); Matilde Muñoz, *La señorita del sombrero feo*; W. Fernández Flórez, *Las siete columnas*; J. Costa Figueiras (Gallegan author), *Los agros de Sureda* (exquisite treatment of the "Patria chica"); J. M. Salaverría, *Retratos*; Alfredo Antigüedad, *Anecdotario*; A. Martínez Olmedilla, *La poesía del recuerdo*; F. Camba, *El tributo de las siete doncellas*; E. Gómez Carrillo, *Fes, la Andaluza*; A. Inaúa, *La mujer, el torero, y el toro* (a triumph); P. Mata, *Más allá del amor*

*y de la vida*; Concha Espina (already being mentioned as a possible Nobel prize winner), *Altar mayor* (great success); J. Más, *La Locura de un erudito* (about Sevilla); "Adebel," *Por una gota de sangre* and *Las dos orillas* (novels of profound emotion and palpitating interest); Joaquín Arderius, *La Duquesa de Nít*; J. R. Coloma, *Amores africanos* (won the 5000-peseta prize in the contest of the publishing house "Voluntad"); and M. Tomás, *La Florista del Tiberiades*. Carmen Valera continues the publication of the *Obras Completas* of her illustrious father Juan Valera (vol. 49, *Miscelánea III* appeared) and of the *Obras Selectas* (vols. 4-9 have appeared, containing in order *El Comendador Mendoza*, *Pasarse de listo*, *Genio y figura*, *Morsamor*, and *Las ilusiones del Doctor Faustino*, 2 vols.). Carlos María Ocantos published vol. 17 of his *Novelas Argentinas: El secreto del doctor Barbado*.

POETRY. Several works that should be listed were presented: J. Vega de Rivera, *Rutas, momentos, lejanías*; J. M. Sabater, *En la noche callada*; Concha Méndez Cuesta, with *Inquietudes*; Pilar de Valderrama, *Huerto cerrado*; J. Enrique Gippini, *Ahora que se abren las Rosas*; Mario Arnold, *Lluvia de besos*; J. A. Balseiro, *Música cordial*; and Marciano Zurita, *Himno a Burgos* (causing a great furor, and already set to music by the composer Calleja). The following items should be mentioned, although the works in some cases have not reached us and in others our information does not include the titles: Hermina Farfina has revealed herself as an admirable poet; and Carlos Lago won the prize at the Toledo *Juegos Florales*. The newspaper *A B C* established a poetic competition with four prizes in honor of the flight of the "Plus Ultra" from Madrid to Buenos Aires. The prize of 5000 pesetas was won by the young poet Antonio Martín Mayor, and one of the other three prizes was won by the poem *Y siempre España!* of Antonio Para Vico.

ERUDITION. The most interesting things in the scholarly output of Spain were the following: Marqués de Laurencín, *Don Agustín de Montiano y Luyando, Primer Director de la Real Academia de la Historia*; Rafael Altamira y Crevea, *Obras Completas*, vols. 56, 57, and 62; Graziela Barinaga y Ponce de León, *Estudio crítico biográfico de Emilio Bobadilla (Fray Candil)*; E. Gómez Baquero (Andrenio), *De Gallardo a Unamuno*; Duque de Berwick y de Alba, *El Mariscal de Berwick*; Institut d'Estudis Catalans, *Cròniques Catalanes, II*; E. Gutiérrez-Gamero, *Mis Primeros Ochenta años (Memorias)*; Darío Rubio, *La anarquía del lenguaje en la América Española*, 2 vols.; Atalo Castañs, *Galicismos, Barbarismos, Hispanismos*; Real Academia de la Historia, *Colección de documentos inéditos de Ultramar*, vol. 19; A. González Palencia, *Historia de la España Musulmana*; W. F. Lichter, *Lope de Vega's El Castigo del Discreto. Of Clásicos Castellanos*, vols. 66, Forner, *Enequias de la Lengua Castellana*, and 69, Calderón, *Autos sacramentales*, have reached us. The most outstanding event of the year was the presentation of the three-volume *Homenage a Ramón Menéndez Pidal*, to celebrate his twenty-five years of teaching.

ROYAL ACADEMY. Two members were elected to fill vacancies: Leopoldo Eijo y Garay, Bishop of Madrid-Alcalá, and Vicente García de Diego, philologist of the Instituto Cardinal Cisneros,

who has already taken his seat. After the death of the lamented Antonio Maura, Ramón Menéndez Pidal was unanimously elected director. In honor of Antonio Maura, the Academy established a prize of 10,000 pesetas to be awarded every four years, in connection with any topic the Academy may announce. This time the topic is *La Oratoria en España en el Siglo XIX*. The Fastenrath Prize was awarded to Angel de Valbuena y Prat, for his *Los autos Sacramentales de Calderón: Clasificación y análisis*. The Academy's own prize for a *Vocabulario de las Obras de Don Luis de Góngora y Argote* went to Bernardo Aleman y Sella, a professor in the University of Granada. The Hispano-American prize was won by the Porto Rican critic and poet, José A. Balseiro, with his essays on aesthetics, *El vigía*. The Premio Piquer, for the best dramatic work produced during the year, went to Joaquín Dicenta Alonso for his *Son mis amores reales*.

**NECROLOGY.** Spanish letters paid heavy tribute to death during 1926. Among the foreign correspondents of the Royal Spanish Academy there were two losses: Enrique Nercasseau y Morán (Chilean philologist and purist), and Manuel Salas Lavaquí (historian, grammarian, and secretary of the Chilean Academy). The native correspondent for Majorca, the poet and critic Juan Alcover y Maspons, passed on. There were also Henri Mérimée (the French Hispanist, director of the Institut Français at Madrid, who followed his father, Ernest Mérimée, all too soon); López Silvia (writer of witty, poetic sonnets that smacked of the soil); Alejandro Pérez Lugín (author of those very celebrated novels *La Casa de la Troya* and *Currito de la Cruz*, which were adapted both to the stage and the silver screen); and the Marqués de Villalinda, Luis Valera (q.v.). There were also three great losses from the Academy itself: the humanist, Adolfo Bonilla y San Martín; the naval Captain Manuel de Saralegui (purist and lexicographer), and Eugenio Sellés, Marqués de Gerona (journalist, publicist, and dramatist).

Adolfo Bonilla y San Martín, who was born in Madrid, Sept. 27, 1875, died there Jan. 18, 1926. He was one of the two favorite pupils of that greatest humanist of the nineteenth century, Marcelino Menéndez y Pelayo, the other of whom, Ramón Menéndez Pidal, as Director of the Spanish Royal Academy, in making the customary eulogy of a departed member, declared that Bonilla y San Martín "exemplified in himself humanism in a sense more ample even than had the illustrious Menéndez y Pelayo, directing his attention to fields much more varied than the master." His first chair, at the University of Valencia, was that of Commercial Law, in which he was so well versed that he published (in collaboration with others) a *Colección de Códigos de Comercio españoles y extranjeros*, and a *Tratado de Derecho Mercantil* and served as Counselor of the Bolsa de Comercio of Madrid, and member of the General Committee on Codification. For a quarter of a century he was professor of the history of philosophy in the University of Madrid, and Dean of its Faculty of Letters during the last years of his life. In the field of the history of philosophy he rose even higher than in law, and wrote two astounding volumes on the *Historia de la Filosofía Española*. Other outstanding philosophical works are his *Luis Vives y la Filosofía*

*del Renacimiento*, *Erasmus en España*, and *Fernando de Córdoba*. Bonilla wrote also concerning aesthetics, social history, and biography; and was a poet and novelist. He was furthermore an authority of first rank in belletristic studies, as witness his *Obras Completas de Menéndez y Pelayo*, *Libros de Caballerías*, *Tristán de Leonís*, *Libro de los Engaños*, *Diablo Cojuelo*, and (in collaboration with his friend Rudolph Schevill) eleven volumes of the *Obras Completas de Cervantes*. These varied scholarly activities explain the many honors that came to Bonilla.

**SPENDER, EDWARD HAROLD.** English journalist and lecturer, died in London, April 15. He was born at Bath, England, June 22, 1864, and was educated at Bath College, where he became head boy in the year 1882-83. He then went to University College, Oxford, where he was exhibitioner. From 1889 to 1892 he was a lecturer for the Oxford University Extension Delegacy. Mr. Spender had begun his journalistic career one year before the expiration of his term as lecturer, with work on *The Pall Mall Gazette*. Later he was associated with *The Westminster Gazette*, *The Daily Chronicle*, *The Manchester Guardian* and *The Daily News*. His biography of General Botha, of South African fame, published in 1916, is noted. He also wrote a biography of David Lloyd George, 1920. Mr. Spender visited the United States in 1920 as one of the delegation from the British branch of the Sulgrave Institution, which presented statues of Edmund Burke, William Pitt and Lord Bryce to the American people. Mr. Spender's post-war books were biographies of former Prime Minister Asquith, 1915, and of Byron, in *Byron and Greece* (1924); and *Men and Mansions* (1925).

**SPIRITUALISM.** See PSYCHICAL RESEARCH.  
**SPIRITUALIST ASSOCIATION, NATIONAL.**

An organization maintaining the religious belief that the spirit world forms a counterpart of the world of common experience. Its members generally hold the doctrine of progression, after bodily death, into this spirit world, and of a final restoration of souls to a state of happiness. The belief is also generally held that those dying in childhood reach maturity in the spirit life. Right living upon earth is held essential to the future welfare in that life. Spiritualists generally oppose war, capital punishment, restrictive medical laws, and all measures believed to tend to political or religious oppression, and they believe in the Golden Rule as the measure of the highest morality. Spiritualism originated as a doctrine in the writings of Andrew Jackson Davis, published in 1845. Its local groups came into existence in considerable numbers in many parts of the United States between 1850 and 1872. The national organization of these groups took the form of the present association in 1893. In 1926 it comprised 22 State associations and many local societies and churches in territory outside the State organizations. There were 690 churches, about 600 ministers, and a church membership of about 126,000. Its mediums numbered approximately 1200. The general activities of the organization are carried on through four bureaus: that of Progressive Lyceums (Sunday Schools); the Bureau of Phenomenal Evidence; the Bureau of Propaganda; and the Bureau of

Education. The organization conducts the Morris Pratt Institute, Whitewater, Wis., and issues the periodicals *Progressive Thinker*, *Banner of Life*, *Reason*, *The National Spiritualist*. Officers in 1926 were: president, Joseph P. Whitwell, St. Paul, Minn.; secretary, Rev. Harry P. Strack, Washington, D. C.; treasurer, F. W. Constantine, Buffalo, N. Y. Headquarters are in Washington, D. C.

**SPONGES.** See ZOOLOGY.

**SPORTS.** Articles covering the activities in the various sports during 1926 will be found under such titles as **ATHLETICS**, **BASEBALL**, **FOOTBALL**, **RACING**, **TENNIS**, etc.

**SPRECKELS, JOHN DIEDRICH.** American capitalist and steamship owner, died at Coronado, Calif., June 9. He was born Aug. 16, 1853, at Charleston, S. C., and was educated at Oakland College, California, and at the Polytechnic School in Hanover, Germany. He was the son of Claus Spreckels, a leader in the sugar industry, and he early saw the need of ships in the development of that industry. While working for his father he began the enterprise which developed into the Oceanic Steamship Co., a pioneer in trans-Pacific trade. In 1880 he founded J. D. Spreckels & Bros., shipping and commission merchants. His other enterprises included the Western Sugar Refining Co., the Spreckels Sugar Co., the Pajaro Valley and San Diego Electric Railway Cos., the San Diego and Arizona Railway, the San Diego Union and Tribune Co., together with several banking houses and hotels. He was also proprietor of *The San Francisco Morning Call*. Mr. Spreckels was well known for his benefactions.

**SQUASH.** See RACQUETS.

**SQUIRE, WATSON CARVOSSO.** American Senator and territorial governor, died June 8. He was born at Cape Vincent, N. Y., May 18, 1838, and graduated from Wesleyan University in 1859. From 1859 to 1861 he was principal of the Moravia, N. Y., Institute, and in 1862 he took the LL.B. degree from the Cleveland, Ohio, Law School. In the Civil War he was a private and then first lieutenant in Co. F of the 19th New York Volunteers. He commanded a battalion of sharpshooters in the Chickamauga campaign. He was made judge advocate for the district of Tennessee, 1864-65, and in the last named year

he was breveted lieutenant colonel "for gallant and meritorious services." From 1884-87 he was governor of Washington Territory. In 1889 he was president of the State convention, and in the same year he became United States Senator. He was reelected in 1891. He was president of the Union Trust Co. as well as president of the Squire Investment Co., Seattle, Wash.

**STAMPS, MEMORIAL POSTAGE.** See CELEBRATIONS.

**STANFORD UNIVERSITY.** A non-sectarian, co-educational institution of higher education at Stanford University, Calif., founded in 1891 in memory of Leland Stanford, Jr. The enrollment for the fall term of 1926 was 3318, and for the summer session 1194. The faculty numbered 483. The productive funds of the University amounted to \$28,917,532.20, and the budget income for the year, including fees, was \$2,557,792.46. The library contained 459,878 volumes. Gifts received during the year were: for research and scholarships, \$158,766.02; special funds, \$16,752.04; for new buildings, \$202,917.77; for endowment \$225,435.99; and \$50,000 from the Rockefeller Foundation for development of the Hopkins Marine Station at Pacific Grove, California. President, Ray Lyman Wilbur, M.D.

**STATE BANKS, SAVINGS BANKS, ETC.** In the *Annual Report* of the U. S. Comptroller of the Currency, issued on Dec. 10, 1926, there were published summaries of reports received as of June 30, 1926, from the State banking departments of the several States and from individual private banks not under State supervision. These reports related to 20,168 banks, or a decrease from 20,769 reporting on June 30, 1925. There were included returns from 16,493 state (commercial) banks, 904 stock savings banks, 620 mutual savings banks, 1656 loan and trust companies, and 495 private banks. The resources and liabilities of these 20,168 reporting banks, other than national, are shown in the accompanying table.

RESOURCES AND LIABILITIES OF 20,168 STATE (COMMERCIAL) BANKS, LOAN AND TRUST COMPANIES, SAVINGS AND PRIVATE BANKS, JUNE 30, 1926  
[In thousands of dollars]

Resources	16,493 State (commercial) banks	1,656 loan and trust companies	620 mutual savings banks	904 stock savings banks	495 private banks	20,168 total banks
Loans and discounts	9,703,248	6,754,087	4,623,594	1,409,868	92,559	22,583,356

\* Including overdrafts.

A summary of the combined returns of 20,168 reporting banks other than national June 30, 1926, showed aggregate resources of \$39,577,738,000, and exceeded the returns from 20,769 associations on June 30, 1925, in the sum of \$1,871,504,000. Loans and discounts of \$22,583,356,000 were \$1,550,273,000 more than in the preceding year; overdrafts of \$39,751,000 showed a reduction of \$1,156,000, and total investments in bonds and securities were increased from \$9,669,669,000 to \$9,972,888,000.

Banking houses, furniture and fixtures, \$860,208,000, were \$44,376,000 more in the current year, and other real estate owned, \$243,048,000, was increased by \$18,753,000.

Balances due from correspondent banks and bankers, including lawful reserve with the Federal reserve bank or other reserve agents amounted to \$3,405,042,000, and showed a decrease of \$75,565,000; checks and other cash items a reduction of \$44,319,000, and exchanges for clearing house a reduction of \$27,115,000. Cash on hand was increased \$44,888,000, or from \$591,681,000 to \$636,569,000. Other resources showed an increase of \$58,210,000.

With the exception of amounts due to correspondent banks and bankers, which showed a reduction of \$53,360,000, all liability items showed increases over the returns of the preceding year.

The paid-in capital stock aggregating \$1,860,431,000 showed an increase of \$60,155,000; surplus of \$2,273,069,000, an increase of \$218,663,000, and undivided profits of \$585,584,000 showed an increase of \$59,856,000.

The amount of individual deposits rose from \$30,411,030,000 to \$31,789,884,000, certified checks and cashiers' checks outstanding were more by \$11,252,000, and United States deposits of \$43,323,000 showed an increase of

\$20,808,000 and \$34,083,000, respectively. Other liabilities were increased by \$137,049,000.

**STATEN ISLAND. ANNIVERSARY OF CONFERENCES DURING AMERICAN REVOLUTION.** See CELEBRATIONS.

**STATE SYMPHONY ORCHESTRA.** See MUSIC.

**STEAM.** See BOILERS.

**STEAMBOAT INSPECTION SERVICE,** UNITED STATES. See SAFETY AT SEA.

**STEAM ENGINES.** The uniflow engine continued to be the predominating type installed in 1926, being used for the first time in a blooming mill, the unit having a maximum rating of 30,000 i.h.p. The largest Corliss engine to be built in 20 years was installed in a steel mill, while a cross-compound, non-condensing, poppet-valve Corliss engine using steam at a temperature of 686° F. was also built. A Corliss engine was designed for the Medical Centre refrigerating plant, New York City. In connection with the uniflow engines, improvements were devised which control the amount of steam going to process and that to the condenser, in much the same way as was done in the bleeder turbine.

**STEAM TURBINES.** The leading features of development in steam turbines during 1926 were the building of more units of large capacity, the increased use of regenerative heating of feed water by steam from the main turbine unit, the introduction of live steam reheaters, and the general improvement of turbines of small capacity through refinements which had been developed for larger units. Other features, as indicated in the "Review" for the year in *Power* were the wide use of bleeding and high-back-pressure turbines to combine power heating and processes, and the employment of condensers of improved design and less surface. During the year, orders were placed with the General Elec-

tric Co. for two 90,000-kw. steam turbines for installation by the Southern California Edison Co., and for a 208,000-kw. turbine generator for the new State Line Station of the State Line Generating Co., near Hammond, Ind., at the southern end of Lake Michigan, to be completed in 1928. A 104,000-kw. unit also was ordered for Chicago.

A compound unit of 160,000-kw. capacity was ordered from the American Brown Boveri Co., for the Hell Gate station of the United Electric Light and Power Co., New York, a cross-compound machine with a 75,000-kw. high-pressure unit running at 180,000 r.p.m. and an 85,000-kw. low-pressure unit running at 1200 r.p.m. Steam was to be supplied at 265 pounds per square inch gauge with 200° F. superheat and the steam to be extracted at two stages to heat the feed water. The generators were designed for 0.85 power factor and to generate at 13,200 to 14,500 volts. The unit will weigh 1400 tons and occupy a floor space 25½ by 69 feet.

The State Line Station unit mentioned above, of 208,000-kw. capacity, will produce energy sufficient to care for a good-sized city. It will require each hour, for steam generating, 120 tons of low-grade Illinois coal, while 24,000,000 gallons of condenser cooling water will be pumped, and 21,000,000 cubic feet of cooling air will be required for the generator. This machine has a high-pressure element of 76,000-kw. capacity, and two low-pressure elements of 66,000-kw. capacity. The steam supplied to the high-pressure turbine at 600 pounds gauge and 730° F. will be exhausted to a reheater using live steam, and after having been raised to a temperature of 500° will be passed to the two low-pressure turbines. The generator, which is designed to generate current at 18,000 volts, will be the largest 1800-r.p.m. generator ever made. The largest turbo-generator to go into service during the year was the 80,000-kw. unit of the Brooklyn Edison Company.

**STEDMAN, HENRY RUST.** American physician and psychiatrist, died February 20. He was born at Boston, Mass., on Sept. 19, 1849, and was educated at Harvard, where he took his A.B. in 1871, and his M.D. in 1875. He was medical house officer at the Boston City Hospital, 1872-73, and surgical house officer at the Massachusetts General Hospital, 1873-74. He visited Europe to acquire experience in foreign methods of treatment, serving as assistant physician at the Edinburgh Royal Asylum, and at the West Riding Asylum, Yorkshire, England, 1881. From 1884 to 1918 he was superintendent and resident physician of the Bournewood Hospital for Mental Diseases, Brookline, Mass. He was a member (president, 1905-06), of the American Neurological Association, and other medical societies. He published many articles in the medical press on the subject of nervous and mental disorders.

**STEEL.** See IRON and STEEL.

**STELLAR EVOLUTION.** See ASTRONOMY; PHYSICS.

**STEVENS INSTITUTE OF TECHNOLOGY.** A non-sectarian institution for the technical education of men, at Castle Point, Hoboken, N. J.; founded in 1870. The enrollment for the autumn of 1926 was 436, and for the summer session of the same year, 93. There were 50 members on the teaching staff. The productive funds amounted to \$2,750,000, and

the income for 1925-26 was \$235,000. The library contained about 17,500 volumes. During the year the Institute received \$52,000 for endowment and other specified purposes, of which the largest single item was \$12,500 by the will of William D. Hoxie. On October 21 President Humphreys presented his resignation after 25 years of service, to take effect June 5, 1927. President, Alexander C. Humphreys, M.E., E.D., Sc.D., LL.D.

**STEVENSON OF HOLMBURY, BARON (JAMES STEVENSON).** A British industrialist, and founder of the British rubber control plan, died at Holmbury, Surrey, England, June 10. He was born at Kilmarnock, Scotland, Apr. 2, 1873, and was privately educated. His chief business interest was the company known as John Walker & Sons, Ltd., whisky distillers, of Kilmarnock, of which company he was for many years the managing director. He rose to prominence in the early days of the World War, serving on the board of the Ministry of Munitions, as director of area organization, as vice-chairman of the advisory committee, and as a member of the central reconstruction committee. He was also a member of the munitions council for ordnance and chairman of the Council Committee of Demobilization and Reconstruction. In 1917 he was created a baronet. At different times he was surveyor-general of supply of the War Office, member of the army council, member of the air council, vice-chairman of the advisory committee on civil aviation, and finally, chairman of the rubber investigation committee and personal commercial adviser to the Secretary of State for the Colonies. In these two capacities he was responsible for the scheme of restricting the supplies of rubber produced and exported. This plan was known by his name and exerted a powerful influence on the world's industrial markets concerned with rubber and rubber goods. He was created a G.C.M.G. in 1922, and in 1924 he became first Baron Stevenson of Holmbury. For his manifold services to the allied cause in the World War, the French Government made him a Commander of the Legion of Honor.

**STEWART, JOHN AIKMAN.** American banker, died December 17, in New York. He was born Aug. 21, 1822, in New York City, and attended public school there. He then went to Columbia College, and after a few years as a civil engineer he was appointed clerk of the board of education of New York City. In 1850 he became actuary of the United States Life Insurance Co., and on the organization of the United States Trust Co., in 1853, the first American trust company chartered exclusively to render fiduciary service, Mr. Stewart became its secretary. In 1856, on the resignation of the first president, Joseph Lawrence, Mr. Stewart was elected president in his place. He was financial adviser to President Lincoln during the Civil War. In Lincoln's administration he was assistant treasurer of the United States, and he held the same post under Grover Cleveland in 1894. In 1868 he became a trustee of Princeton University, discharging the duties of this office for 58 years. For a short period he acted as president of Princeton University, during the absence of Woodrow Wilson.

**STOCKING, WILLIAM ALONZO.** American dairy husbandman, died February 3. He was born at Simsbury, Conn., May 13, 1872, and

graduated from the Connecticut Agricultural College in 1895. Three years later he received the B.S.A. degree from Cornell University, and that of M.S.A. in 1904. From 1906-09 he was assistant professor of dairy industry in Cornell University, and from 1909 to his death was professor. In 1913-14 he was acting director of the New York State College of Agriculture at Cornell University. He was a member of the American Society of Bacteriologists, and from 1916-18 was president of the American Dairy Science Association. He was the author of *A Manual of Milk Products*.

**STOCKMAN, SIR STEWART.** British veterinarian, died June 3. He was born in Scotland Sept. 27, 1869, and was educated at the Royal High School, Edinburgh, and at the Royal Veterinary College, Edinburgh. He afterwards studied in Paris and Brussels. He was a member of the Royal College of Veterinary Surgeons and was appointed professor of pathology and bacteriology in the Royal Veterinary College, Edinburgh, a post he held from 1892 to 1899. In 1900 he served in South Africa during the Boer War, and received a medal with four clasps in recognition of his various services. In 1902-03 he served in the Indian civil service veterinary department, and from 1903 to 1905 he was principal veterinarian of the Transvaal department of agriculture. In addition to numerous reports appearing in government blue books and articles in the veterinary press, he was the author of *A Textbook of Meat Inspection*. He was knighted in 1913.

**STOCKS AND BONDS.** See FINANCIAL REVIEW; RAILWAYS.

**STONE.** The total production of stone in 1925, as reported by the U. S. Bureau of Mines, with figures for sandstone and limestone not available, totalled 115,851,370 short tons, valued at \$174,216,792, as compared with 103,184,120 tons valued at \$161,870,113 in 1924. The 1925 production, with value, included 8,074,200 tons of granite, \$30,531,347; basalt and trap rock, 11,842-110 tons, \$14,770,042; sandstone, 4,479,330 tons, \$10,920,016; marble, 504,150 tons, \$13,882,457; limestone, 85,649,440 tons, \$98,008,028; and other stone to the amount of 5,242,140 tons, valued at \$6,104,902. The principal item in 1925 was crushed stone, which was valued at \$80,508,429, followed by building stone valued at \$35,448,809; furnace flux to the amount of \$17,344,190, and monumental stone, \$14,401,339. The imports of stone during the year 1926 consisted of marble, breccia, and onyx valued at \$64,507, and building and monumental stone valued at \$981,097.

**STONE, GALEN L.** American financier, died at Brookline, Mass., December 27. He was born at Leominster, Mass., in 1862, and became a reporter on *The Commercial Bulletin*. His connection with this paper showed him the necessity for studying the investment market at first hand, and he took a situation with a brokerage firm. Here he met Charles Hayden, a graduate of the Massachusetts Institute of Technology, and the two decided to go into partnership. About 1890 they founded the investment house of Hayden, Stone & Co. In a short time they had extended the sphere of their operations from copper companies to include steamships, railroads and other enterprises, and at one time Mr. Stone was a director of more than 20 large companies. In 1923 he retired to

give his time to his artistic, musical, and philanthropic interests, and in 1924 he presented a collection of valuable Chinese paintings to the Fogg Art Museum of Harvard. In 1925 he gave \$75,000 to the cause of negro education. He was a trustee of Wellesley College, and was at one time a vice-president of the Boston Symphony Orchestra.

**STORROW, JAMES JACKSON.** American banker, died March 13. He was born at Boston, Jan. 21, 1864, and was educated at Harvard, graduating in 1885, and receiving the degree of LL.B. in 1888 for work in the law school. He was a director of numerous companies and institutions, among them being the United States Smelting, Refining and Mining Co., the United States Mining Co., the Centennial Eureka Mining Co., etc. In 1900 he became a member of the firm of Lee, Higginson & Co., bankers, of Boston.

**STRAITS SETTLEMENTS.** A British crown colony in Malaysia, consisting of Singapore, Penang (with Province Wellesley and Dindings), and Malacca. The area is approximately 1600 square miles; population, according to the census of 1921, 883,769; estimated in 1924, 960,952. The estimates for the various parts in 1924 were as follows: Singapore, 217 square miles, with 474,817 inhabitants; Penang (with Province Wellesley and Dindings), 280 square miles, with 315,841 inhabitants; Malacca, 720 square miles, with 170,294 inhabitants. In 1924 there were 181,430 immigrants from China and 43,147 from Southern India. The movement of population in 1924 was: Births, 31,028; deaths, 26,358. The seat of the government is Singapore, one of the great ports of the East, containing the greater part of the population of the island of Singapore. In 1924 there were 204 schools (all government-aided), with an enrollment of 38,607, and an average attendance of 36,045. The chief interest is commerce, mostly transit trade (the ports are free from customs duties). The centre of trade is Singapore. The accompanying table from the *Statesman's Year Book* for 1926 shows exports and imports, exclusive of treasure, in 1924:

	Imports 1924 £	Exports 1924 £
Singapore .....	74,309,889	64,284,550
Penang .....	26,503,727	25,905,801
Malacca .....	2,656,970	3,430,448
Labuan .....	389,987	382,895
Christmas Islands .....	50,155	282,791
Dindings .....	98,257	800,074

The chief imports in that year, according to value, were: Para rubber, tin ore, rice, cotton piece goods and yarn, tobacco, cigars, and cigarettes, sugar, and dried and salted fish. The chief exports, also according to value, were: Para rubber, tin, copra, pepper, preserved pineapples, tapioca, and sago. In 1924 the revenue was £3,341,235 and the expenditure £3,115,737. The total number of merchant vessels entered at the ports of the colony in the same year, exclusive of native craft, was 9859, with a tonnage of 16,326,880 tons; native craft, 30,948 of 1,120,157 tons. The number of vessels cleared was 9845 of 16,290,221 tons; native craft, 31,973 of 1,161,768 tons.

There are railways from Singapore to Woodlands on the Johore Straits; from Parit Buntas

in Krian to a point in Province Wellesley; from Malacca to Tampian in Negri Sembilan. The administration is under a governor, aided by an executive council of official members, and a legislative council of official and unofficial members, the latter being nominated or selected by the chambers of commerce of Singapore and Penang. Governor in 1926, Sir Laurence N. Guillemard (also high commissioner for the Federated Malay States and Brunei, and British Agent for North Borneo and Sarawak). Under the administration of the Straits Settlements are the Christmas Islands (q.v.), annexed in 1900; Cocos or Keeling Islands, annexed in 1903; and the colony of Labuan, annexed Jan. 1, 1907.

**STRAUS, OSCAR SOLOMON.** American diplomat and publicist, died May 3. He was born at Otterberg in Rhenish Bavaria, Dec. 23, 1850, and with his family moved to the United States, where he lived, first at Talbotton, Ga., and later at Columbus, Ga., until 1865, when he removed to New York. In 1871 Mr. Straus graduated from Columbia College and then studied at the Columbia Law School, graduating in 1873. In 1887-89 he was minister to Turkey, and his services were so satisfactory that President McKinley reappointed him to the same post in 1897 and he remained in it until 1900. In 1902 he filled the place of Ex-President Harrison as a member of the Permanent Court of Arbitration at The Hague. Mr. Straus was Secretary of Commerce in the cabinet of President Roosevelt, 1906-09, ambassador to Turkey, 1909-10, Progressive candidate for the governorship of New York, 1912, and in 1915 was appointed chairman of the Public Service Commission (first district) of New York State. He was noted for his active and practical philanthropy, especially among the New York poor. His published works include: *The Origin of the Republican Form of Government in the United States* (1885; 2nd ed., rev., 1901); *The Development of Religious Liberty in the United States* (1896); *United States Doctrine of Citizenship* (1901); *The American Spirit* (1913); and *Under Four Administrations* (1922).

**STRIKES AND LOCKOUTS.** SUPREME COURT DECISION OF OCTOBER 25. "It now seems clear that our various State legislatures may declare strikes for certain objects to be unlawful, and anyone urging such a strike may be deemed guilty of a felony and be subjected to fine and imprisonment. This decision in the *Dorchy* case will undoubtedly be the forerunner of several attempts to curtail the right of labor unions to strike."

It was with this comment that *The American Federationist* (organ of the American Federation of Labor) greeted the decision of the United States Supreme Court on October 25, upholding the constitutionality of the Kansas statute making strikes under certain conditions and for certain purposes illegal. The Kansas statute was part of the Industrial Court Act, designed to regulate labor disputes by State means. It declared strikes in mines illegal, and also in the case of other disputes it provided an industrial court for the submission of grievances. A union leader named *Dorchy* ignored this latter provision of the law, and

called a strike in order to enforce a wage claim for a fellow-member. The Supreme Court held that in view of the fact that he ignored the existing machinery for the settlement of such a claim, he could be prosecuted, under the State law, for extortion. The decision was written by Justice Brandeis, and said, in part:

The right to carry on business—be it called liberty or property—has value. To interfere with this right without just cause is unlawful. The fact that injury was inflicted in a strike is sometimes a justification. But a strike may be illegal because of its purpose, however orderly the manner in which it is conducted. To collect a stale claim due to a fellow-member of the union who was formerly employed at the business is not a permissible purpose.

To enforce payment by a strike is clearly coercion. The legislature may make such action punishable criminally as extortion, or otherwise. And it may subject to prosecution him who uses the power of influence incident to his office in a union to order the strike. Neither the common law nor the Fourteenth Amendment confers the absolute right to strike.

It is significant that another feature of the Kansas Industrial Court Act, providing for the regulation of wages and hours, has been invalidated through recent decisions of the Supreme Court both in a case arising out of this act and in a case arising out of a similar statute elsewhere. (See 1925 YEAR BOOK, under LABOR ARBITRATION.)

**HISTORY.** For an account of the British coal strike and the nine-day general strike which was provoked by it, see under GREAT BRITAIN, *History*. In the United States, the leading strikes during the year were the anthracite coal strike, which began in September, 1925, and was settled on Feb. 18, 1926; the strikes of furriers and of the cloak and suit unions in the New York district; and the strike of textile operators in New Jersey mills.

The coal strike settlement came after months of ineffective intervention on the part of the Governor of Pennsylvania and on the part of representatives of the United States Department of Labor. Suddenly, however, a settlement was drawn up through secret negotiations between President Lewis, of the miners' union, and Richard Grant, head of the Susquehanna Collieries Co., who had previously held conferences with the operators. The settlement was signed on February 12, it was ratified by the assembled miners on February 16, and the digging of coal began on February 18. The strike had lasted since September 1, had tied up 272 collieries and 828 mines owned by 135 companies, and had brought about a shortage in coal estimated at 30,000,000 tons. The wage loss was \$1,150,000 a day.

Under the terms of the settlement, the miners and the operators signed a 4½-year wage contract at the rates in effect when the strike began. As regards compulsory arbitration, which had been the principal stumbling block to an early settlement, a compromise was effected. See COAL.

The other strikes that we have mentioned above were caused directly or indirectly through Communist or "left wing" activities within the ranks of American labor. It should be noted, however, that the textile strike which began in Passaic, N. J., on January 25, falls in a class by itself. Though organized by a professed Communist, Albert Weisbord, this strike won much public sympathy because it was a fight against bad working conditions, and also

because of the arbitrary police methods which were invoked by the mill owners to fight the walk-out. It should be added that the 11,700 men who walked out under the leadership of Weisbord had previously been ignored by the American Federation of Labor; the union was afterwards turned over to the regular organization when it was seen by Weisbord himself that his continued leadership was an obstacle to a settlement.

The strike, however, was in a large measure a failure. The men had contended for the recog-

York joint board and made the best terms he could with the "inside manufacturers." But, as he was unable to hold the jobbers or merchants responsible for conditions among the numerous and small contracting establishments, chaotic conditions resulted in this part of the trade. The cost of the strike to the union was at least \$2,500,000 (exclusive of the wage loss to the men); and besides facing an empty treasury and mortgaged buildings, the union had to recognize that the physical strength of the organization was gone.

NUMBER OF DISPUTES IN SPECIFIED INDUSTRY GROUPS

Industry	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925

nition of the union, for the restoration of the 10 per cent wage cut of October, 1925, and for an additional increase of 10 per cent. When a settlement was finally effected in mid-December with the most important mill, all that the strikers secured was a recognition of the union. The fight against the other mills was being continued at the end of the year, and there seemed no definite likelihood that these mills would abandon their open-shop attitude.

Both the furriers' and the cloakmakers' strikes were brought about through the victory of Communist elements within regularly organized American Federation of Labor unions. In the case of the furriers, a strike which lasted 17 weeks was called early in the year by the joint board managing the New York locals. The strike, under the leadership of the Communist Ben Gold, was more or less successful, since the men succeeded in gaining at least one objective, the five-day week in those months when there is little work. However, when the management of the strike was investigated by the American Federation of Labor officials, a great amount of graft and corruption was revealed. The cost of the strike to the union was well over \$1,000,000.

The cloakmakers' strike, also called by the Communist joint board in charge of the New York locals, was the most disastrous in the history of that union. Refusing to accept the report of the Governor's mediation board as a basis for a new agreement with the manufacturers and jobbers, the Communist element had called the strike to enforce a number of demands, such as a 40-hour week, a guarantee of a minimum employment period, and the responsibility of the jobbers in enforcing union conditions on the contractors. The strike lasted from July 1 to the end of December, and involved 40,000 men. In the end, the management had to be taken over by President Sigman of the International Union, who removed the New

NUMBER OF MEN DIRECTLY INVOLVED IN STRIKES

1916	1,599,917	1921	1,099,247
1917	1,227,254	1922	1,612,562
1918	1,289,989	1923	756,584
1919	4,160,848	1924	654,641
1920	1,463,054	1925	428,218

**STUDENTS IN UNIVERSITIES AND COLLEGES.** See article, UNIVERSITIES AND COLLEGES.

**STYRIA**, stîr'î-â. A crownland of Austria before the collapse of the Austro-Hungarian Empire; the greater part of Styria was retained in the new republic of Austria after the treaty. Area before the war, 8802 square miles, with a population of 1,441,157 (as estimated on Dec. 31, 1910). Area and population, according to the census of Mar. 7, 1923, 6323 square miles and 978,845 inhabitants.

**SUBMARINES.** See VESSELS, NAVAL, ETC.; NAVAL PROGRESS.

**SUBWAYS.** See RAPID TRANSIT.

**SUDAN**, ANGLO-EGYPTIAN. A territory in the Nile region of Africa, extending south from Egypt to British East Africa and the Belgian Congo; bounded on the east by the Red Sea, Eritrea, and Abyssinia, and on the west by French Equatorial Africa; under British authority. Area estimated at 1,014,400 square miles; population in 1924 estimated at 5,825,247. Capital, Khartum, with a population of 30,627; other cities, Omdurman, 78,024; Khartum North, 14,319. On Jan. 1, 1925, the elementary vernacular schools numbered 91 with about 7,670 pupils; there are also 10 primary schools. The principal products are gum arabic and ivory, of which latter product the country is the chief source; sesame, senna, peanuts, hides and skins, dates, durra (the principal grain crop), and gold. The acreage under cotton in 1924 was given at 111,666 acres, and the 1924-25 crop was estimated at 8100 tons of lint and

16,200 tons of cotton seed. A considerable increase was expected in 1925-26 because of the completion of the Sennar dam and the extension of rain-grown cotton. Of minerals, gold is the only one that has been successfully exploited. No later statistics on commerce were available than those given in the preceding YEAR BOOK, when exports and imports were valued at ££9,382,108. The budget estimates for 1925 balanced at ££3,688,000. The railroad mileage is approximately 1800, and there is regular service by government passenger and cargo steamers for about 2500 miles on the Nile and its tributaries. Under a convention between the British and Egyptian governments signed at Cairo, Jan. 19, 1899, the region south of the 22nd parallel of latitude is administered by a governor-general appointed by the Egyptian government with the assent of Great Britain. The Sudan has been divided into 15 provinces, each under a governor. Since 1910 the governor-general has been assisted by a council. Governor-general in 1926, Sir G. F. Archel.

**SUEZ CANAL.** In 1925 a new record was made at the Suez Canal by the passage of nearly 27,000,000 tons of shipping. This emphasized the importance of the improvements in progress in accordance with the 1921 programme which aimed at a depth throughout the canal of 42 feet 6 inches and a widening of the deep-water channel throughout the navigation, along with the reduction of curves. In 1925 the record for cargo tonnage made in 1913 with the passage of 25,776,000 tons of cargo through the Canal was broken by the passage of 26,578,000 tons. Likewise there was an increase in the average size of vessels in 1925, so that in that year the net tonnage amounted to 26,762,000 tons, as compared with the previous record of 20,275,000 tons made in 1912. The number of transits in 1925 was 5337, as compared with 5373 in 1912.

The net tonnage of ships passing through the Suez Canal in 1926 failed to reach the record established in 1925, which year was the most prosperous in the history of the Suez Canal. The number of ships passing through totaled 4980 or 357 less than in 1925, and 393 less than in the pre-war record year of 1912. The average net tonnage per ship increased from 3,773.51 tons in 1912 to 3,939.82 tons in 1913, to 4,902.38 tons in 1924, to 5,014.61 tons in 1925 and to 5,232.93 tons in 1926. The average size of American ships transiting the Suez Canal in 1926 was 6,117.78 tons.

The accompanying table gives the Suez Canal commercial traffic statistics by flags for the year ending June 30, 1926.

In 1925 shipping under the American flag passing through the Suez Canal reached 732,000 tons or 33 per cent of the tonnage to and from the United States in that year, which was 212,000 tons of net tonnage and 2,388,000 tons of cargo tonnage. In 1925 ships of a single American line, which had established in 1924 a westward round-the-world fortnightly service, to the amount of 184,000 net tons passed through the Canal. In 1925, 19 American tank ships totaling 129,000 net tons with mineral oil cargoes passed southward through the canal and 10 of these vessels passed northward in ballast after discharging their cargoes bound for New York. No American tanker was noted in the canal in 1913.

**SUEZ CANAL COMMERCIAL TRAFFIC STATISTICS, YEAR ENDED JUNE 30, 1926**

[This statement, compiled from the Suez Canal Bulletin, includes all vessels transiting the canal]

Flag	Number of transits	Gross tons	Net tons
American	124	1,021,524	762,983
Belgian	3	15,226	11,000
British	2,800	20,799,411	15,028,998
Danish	79	454,815	327,971
Dutch	521	3,718,154	2,701,721
Egyptian	4	8,560	6,123
Ecuadorian	1	2,269	1,618
Finnish	6	24,427	18,394
French	387	2,446,410	1,684,114
German	886	2,708,212	1,940,027
Greek	32	114,011	84,951
Italian	324	1,883,267	1,322,198
Japanese	159	1,279,039	943,716
Norwegian	107	622,719	458,927
Panamanian	1	20,669	13,324
Portuguese	2	3,793	2,386
Russian	6	52,298	37,466
Siamese	2	2,018	1,840
Spanish	23	101,611	73,207
Swedish	58	365,611	270,514
Yugoslavian	1	5,759	4,187
Total	4,976	35,579,683	25,690,095

NOTE: The total tolls collected during the year ended June 30, 1924, were 177,567,000 francs (\$34,270,481, normal rate), and the total merchandise carried was 23,914,000 weight tons; for 1925 the corresponding figures were 198,357,000 francs (\$38,282,901) and 27,187,000 weight tons; for 1926 they were 185,329,000 francs (\$35,768,497) and 25,431,000 weight tons. The weight of merchandise carried is based upon reports of masters, which are expressed in avoirdupois and metric tons (2,240 and 2,204 pounds, respectively) and in cubic-feet tons (40 to 50 cubic feet to the ton), so that it is only approximately correct.

**SUGAR.** The world sugar production for the season 1926-27, as estimated by Willett and Gray on Dec. 16, 1926, was 23,217,000 tons, a decrease of 1,167,810 tons compared with the preceding year, and about 400,000 tons less than in 1924-25. Of the total production in 1926-27, 15,452,000 tons was from cane crops and 7,765,000 from beets. The production of sugar from cane in Louisiana was only 88,000 tons, compared with 124,447 tons in 1925-26. Much interest had been aroused in that State in the production of sugar from beets, and successful experiments were made during the year, by the experiment station, in the adaptation of cane mills to handling beets. Root rot and the borer had increased the difficulties of growing sugarcane in that State. A combination of cane and beet would serve to extend the season of operating sugar houses.

Cuba is by far the largest producer of sugar of all countries, about one-third of the total crop of sugar from cane being credited to that country. The unusually heavy crop in 1924-25, amounting to 5,126,000 tons, and the prospect of another heavy crop in 1925-26, caused much apprehension early in the year because of the attendant effect on world prices and the fear that the price would be depressed below cost of production. This brought about proposals in Cuba for curtailment of the 1925-26 crop, resulting in a decree restricting that crop to 90 per cent of the indicated production. This reduced a prospective crop of over 5,300,000 tons to about 4,769,000, later adjusted to 4,884,658. This restriction having little immediate effect on prices, President Machado early in September prohibited the harvesting of the 1926-27 crop, then growing, until after Jan. 1, 1927. This had some effect on prices, but to meet the

situation further, a decree was issued November 18 curtailing the crop to 4,500,000 tons. This caused the market to advance rapidly. See CUBA.

Estimates of the other leading countries, as reported by Willett and Gray, were as follows, in tons: British West Indies, 208,000; French West Indies, 80,000; Dominican Republic, 335,000; Mexico, 175,000; Central America, 103,000; Brazil, 700,000; Argentina, 486,000; Peru, 275,000; other South American countries, 145,000; British India, 3,000,000; Java, 1,970,000; Formosa and Japan, 450,000; Philippine Islands, 520,000; Australia, 425,000; Fiji Islands, 85,000; and Africa, 617,000.

The sugar-beet acreage in the United States was somewhat larger than in 1925, but still considerably below that of 1924. The year was a favorable one, however, and the estimated production, 7,537,000 tons of beets, was larger than for either of the two preceding years. Beet-sugar production was estimated at 810,000 tons, compared with 804,439 in 1925 and 974,185 in 1924. In Europe, Germany led in beet-sugar production, with an estimated outturn of 1,675,000 tons, followed by Czecho-Slovakia with 1,050,000; Russia and Ukraine, 900,000; France, 700,000; Poland, 575,000; Italy, 300,000; Holland, 300,000; Spain 290,000; and Belgium, 280,000.

The United States Bureau of Standards was conducting experiments in the production of levulose sugar, particularly in adapting sugar house factories to turning out this product. The production of maple sugar in the ten leading States was reported at 34,750,000 pounds measured as sugar, of which about 3,250,000 pounds was in the form of sugar and the remainder in 3,990,000 gallons of syrup. See CHEMISTRY, INDUSTRIAL.

**SULPHUR.** The production of sulphur in 1926 in the United States amounted to 1,890,057 long tons, compared with 1,409,262 long tons in 1925, an increase of 34 per cent, according to the U. S. Bureau of Mines. The salient feature of the sulphur industry in 1926 was the record-breaking shipments, which totalled 2,072,687 tons, valued at approximately \$37,300,000, compared with 1,858,003 tons, valued at approximately \$29,000,000, in 1925, the previous record year. Production figures were second only to those of 1923 and, while still about 183,000 tons less than shipments, were closer than they had been since the closing down of the Sulphur mine, Louisiana, in 1924. Over 99.9 per cent of the production was made by two companies in Texas, which used the Frasch or hot water process, while over 99.9 per cent of the shipments was made by these companies and the company in Louisiana which was still shipping from stocks. The price for sulphur was considerably higher in 1926 than in 1925. *Chemical and Metallurgical Engineering* quoted a range of \$17 to \$19 a ton f. o. b. mines, the lower price holding for the first three months of the year and the higher price for the remainder.

Exports of sulphur or brimstone from the United States totalled 576,966 tons in 1926, valued at \$10,918,580. Exports of refined, sublimed, and flowers of sulphur totalled 12,002,105 pounds, valued at \$236,146, exported mainly to Canada, Mexico, France, and Australia. In 1925 the exports of sulphur or brimstone amounted to 629,401 tons and the exports of refined, sublimed, and flowers of sulphur

amounted to 6,381,791 pounds. The exports in 1926 were second only to the record exports of 1925.

In Sicily approximately 208,000 metric tons of sulphur were produced in 1926 and it was expected that the shipments would amount to between 260,000 and 270,000 tons, caused by the withdrawal of supplies from surface stocks, reducing the stocks of Sicilian sulphur to between 50,000 and 60,000 metric tons, or the lowest figure in the recent history of the local industry. It was rumored that Mussolini contemplated an extensive scheme of electrification to restore the industry and possibly place it in a position to compete with the United States. Chile, during 1926, had its normal production of from 5000 to 10,000 tons, while Japan was producing between 35,000 and 45,000 tons, the production practically balancing the consumption. The annual sulphur consumption of the world ranged from 2,000,000 to 2,500,000 tons.

**SUMATRA.** See DUTCH EAST INDIES.

**SUN.** See ASTRONOMY.

**SUNDAY SCHOOL UNION.** AMERICAN. A volunteer association composed of members of different denominations of the Protestant Church, whose object is to establish and maintain Sunday schools and to publish and circulate moral and religious publications. It was established in 1817 as the Sunday and Adult School Union. By the contributions of individuals, churches and Sunday schools, it sustains missionaries and supports its general work, which is carried on by 13 districts. In the year ending Feb. 28, 1926, there were 874 schools organized and 584 schools reorganized, with a total of 4738 teachers and 45,964 scholars. Sermons and addresses delivered by workers of the Union during the year numbered 22,927 and prayer meetings established numbered 317. There were 185 Young People's Societies formed; 214 preaching stations opened; 41 churches of various denominations organized; and 13 churches built. During 1926 the Union commissioned 223 missionaries, 34 of whom served only part of the year, and who, while exploring new territory or working in districts previously covered, visited 208,862 families in their homes and distributed 5281 Bibles, 8379 New Testaments, and 14,000 copies of the Gospel of John. Missionary work is carried on chiefly in rural districts and among the negroes of the South. The Union publishes and circulates books and supplies needed by the schools and homes which it serves, as well as carrying forward the interdenominational work of the general Sunday school movement. The total number of books, booklets, maps, charts, and other Sunday school requisites issued during the year was 292,481. Books given to Christian workers, theological students, and others, from special funds provided for the purpose, numbered 462. The Union circulated 12 Sunday school periodicals, weekly, monthly, or quarterly, for officers, teachers, and scholars, to the number of 2,013,740 copies. The largest of the publications is the *Sunday School World*. There were 505 enrolled in Teacher Training Classes during the year. Daily Vacation Bible Schools are held in rural communities. In 1926 there were 384 such schools meeting daily, usually for a period of two weeks, in 33 states, with an enrollment of 10,417, and an average daily attendance of 7792. The income for the year ending Feb. 28, 1926, was \$593,690.59 and

expenditures \$619,752.64. The officers in 1926 were: E. Clarence Miller, president; James M. Snyder and Robert L. Latimer, vice-presidents; William H. Hirst, recording secretary. National headquarters are at 1816 Chestnut Street, Philadelphia.

**SURGERY.** See MEDICINE AND SURGERY.

**SURINAM.** See DUTCH GUIANA.

**SVEČENSKI, LOUIS.** American violinist, died in New York, June 18. He was born at Esseg, Croatia, Nov. 6, 1862. After completing his studies at the University of Agram, he won a government scholarship and went to the Akademie der Musik at Vienna, where his teachers were J. Grün for violin and J. Hellmesberger for composition, 1881-5, while among his classmates were Franz Kneisel and Fritz Kreisler. He was brought to the attention of Wilhelm Gericke, conductor of the Boston Symphony Orchestra. Svečenski went to Boston in 1885 as one of the first violins of the orchestra, and remained until 1903. When Kneisel founded his famous quartet, in 1886, Svečenski became the viola player and held this position without interruption until the dissolution of the organization in 1917. In 1904 he joined the faculty of the Institute of Musical Art, in New York, retaining this post till his death. From 1924 on he also had charge of the class in chamber music at the Curtis Institute of Music in Philadelphia. He was the author of a pedagogical work, entitled *Twenty-five Technical Exercises for Viola*.

**SWARTHMORE COLLEGE.** A non-sectarian, coeducational college at Swarthmore, Pa.; founded in 1864 by the Society of Friends. The 1926 fall enrollment was 561. The faculty numbered 54. The endowment and productive funds amounted to \$3,500,000. The library contained 57,000 volumes. The honors courses, for which the General Education Board in 1925 had granted \$240,000 for a five-year period, continued to be developed. A gift for the erection of a building to house the Friends' Historical Library was made by Clement M. Biddle. Mrs. Isaac H. Clothier of Philadelphia gave \$100,000 in memory of her husband. President, Frank Aydelotte, LL.D.

**SWAZILAND, swā'ze-lānd.** A British protectorate in South Africa, situated north of Zululand, at the southeastern corner of the Transvaal; formerly under the South African Republic; controlled by the British government acting through a high commissioner of the Union of South Africa. Area, 6678 square miles; population at the census of 1921, 133,563, of whom 2200 were Europeans. Capital, Mbabane. The inhabitants are largely of the Zulu type. The chief agricultural products are: Corn (the staple product), tobacco, millet, various vegetables, peanuts, and cotton. Livestock in 1924 included 1000 horses, 250,000 cattle, 200,000 native sheep and goats, and 9500 pigs. About 350,000 sheep are brought into Swaziland from the Transvaal each year for winter grazing. Mineral resources are considered rich, but are undeveloped. The revenue for 1924-25 was £89,710 and the expenditure £87,597. As noted above, the territory is under the administration of the High Commissioner for South Africa, but the local administration is under a resident-commissioner; in 1926, D. Honey.

**SWEDEN.** A Scandinavian kingdom in the extreme northwestern part of Europe, occupying

the eastern and larger part of the Scandinavian peninsula. Capital, Stockholm.

**AREA AND POPULATION.** The total area of Sweden is 173,105 square miles; the population, according to the census of 1920, was 5,904,489; estimated, Dec. 31, 1924, 6,036,118. The population per square mile in 1924 was 34.8. The movement of population in the same year was: Births, 109,009; deaths, 71,991; marriages, 37,484; immigrants, 5942; emigrants, 10,671, of whom 7036 migrated to the United States. Cities with more than 100,000 inhabitants at the beginning of 1925 were Stockholm, 438,896; Göteborg, 229,638; and Malmö, 116,144.

**EDUCATION.** Primary instruction is free and compulsory between the ages of 7 and 14. In 1924 there were 26,297 teachers and 685,382 pupils in the public elementary schools. In the same year there were 77 public secondary schools with 29,722 pupils; 51 people's high schools with 3110 pupils; 2 high and 7 elementary technical schools with about 2800 pupils. There are two universities, Upsala, founded in 1477, and Lund, founded in 1668. The former had 2806 students, and the latter, 1773 students, in the fall of 1924. Besides, there are navigation schools, agricultural schools, veterinary schools, etc.

**PRODUCTION.** The value of all crops in 1925 was given at 1,242,000,000 crowns, an increase of 45,000,000 crowns over 1924. The following table from the *Statesman's Year Book* for 1926 shows the acreage and yield of the principal crops in 1925:

Crop	Acreage (hectares)	Produce (tons)
	1925	1925
Wheat	146,798	375,339
Rye	352,053	713,287
Barley	186,498	320,113
Oats	728,882	1,225,006
Mixed corn	265,584	546,077
Leguminous crops *	46,968	72,610
Potatoes	158,803	2,194,010
Roots *	135,987	4,713,772
Hay	1,684,723	5,221,051

\* Peas, beans, and vetches.

\* Sugar-beet and fodder-roots.

A census of livestock showed 728,000 horses, 2,736,000 head of cattle, 1,568,000 sheep and lambs; and 1,011,000 pigs.

The factory value of all raw, semi-finished, and finished materials produced within Sweden during 1924 aggregated 4,543,000,000 crowns, as compared with the 1923 figure of 4,163,000,000 crowns. Since the wholesale-price index, as computed by the Swedish Board of Trade, remained practically static during the two years 1924 (at 162) and 1923 (at 161), the 9 per cent increase in value denotes an equivalent increase in volume. Particularly noticeable was the gain in output of Swedish mines and metal industries, although it should be recalled that the iron and steel industries during 1923 were seriously hampered by labor conflicts. The production of iron ore increased from 5,600,000 metric tons in 1923 to 6,500,000 metric tons in 1924; of pig iron from 282,607 tons to 513,225 tons; cast iron and steel from 270,680 tons to 500,942 tons; and wrought and rolled iron and steel from 430,404 tons to 743,777 tons. There was also a significant rise in output value of the electrical, machinery, and engineering industries, from 96,000,000 crowns to 133,100,000 crowns. In lumber production, little change was

noticeable, but in the wood-pulp and paper industries a substantial increase was recorded. The dry weight of mechanical and chemical wood-pulp rose from the 1923 figure of 1,400,000 metric tons to 1,700,000 metric tons for 1924, and paper from 392,619 to 457,258 metric tons. In the chemical industry a general expansion occurred during 1924. Artificial fertilizers increased by 24,000 metric tons, to a total of 250,216 metric tons. The production of matches increased by slightly more than 1000 metric tons, to 34,245 metric tons, a figure still considerably below the pre-war output. Increases were also made in the cases of fats and oils, varnishes and paints, and explosives.

COMMERCE. By the development of its industries during the past quarter century Sweden has acquired an important rôle in world trade. This prominence, however, is gauged not so much by actual figures as by the quasi-monopolistic character of several of its chief export items. Intensive utilization of domestic resources has been the keynote for trade development, since Sweden possesses no colonies or dependencies to supply it with raw materials or to afford exclusive markets. Reliance must therefore be placed upon native resources, supplemented by imported raw materials, in order to insure prosperity and maintain and advance the country's position as a trading nation.

Four prime factors contribute to the prominence enjoyed by Sweden as a trading nation: Large natural resources (timber, minerals, electric power, and fertile soil); highly developed and diversified industries; a high standard of living supported by large purchasing power; and efficient engineering talent with abundant skilled and unskilled labor. For its basic industries, such as saw-mills, wood-pulp and paper manufacture, mining, iron and steel production, engineering, and the making of matches, there are available within the country practically all the necessary raw materials. Coal alone forms an exception, the domestic deposits being limited; but this handicap was being overcome by the gradual electrification of industry, made possible by development of the vast supply of hydroelectric water power.

Swedish imports and exports had increased steadily since 1923. In 1924 the volume of both imports and exports had almost equaled pre-war dimensions. In 1925, with the heavy gains in exports and imports, it was safe to suppose, pre-war volume was eclipsed. The development during post-war years, as compared with 1913, is shown in the following table:

POST-WAR VALUES OF SWEDISH IMPORTS AND EXPORTS  
[In Swedish paper crowns \*]

Year	Imports	Exports	Import surplus
1913.....	846,537,568	817,347,039	29,190,529
1919.....	2,533,977,225	1,575,686,838	958,290,382
1920.....	3,314,111,861	2,278,295,098	1,035,816,268
1921.....	1,258,719,045	1,097,270,686	161,448,409
1922.....	1,114,162,449	1,153,710,755	<sup>b</sup> 39,548,306
1923.....	1,294,527,587	1,142,095,263	152,432,324
1924.....	1,424,490,413	1,260,953,598	163,536,820
1925.....	1,486,051,000	1,357,093,000	78,958,000

\* Average exchange rate of the crown for years stated was: 1913, 26.8 cents; 1919, 25.56 cents; 1920, 20.50 cents; 1921, 22.56 cents; 1922, 26.18 cents; 1923, 26.57 cents; 1924, 26.54 cents; and 1925, 26.85 cents.

<sup>b</sup> Export surplus.

Germany still retained the leading position as a source of Swedish imports, followed by

Great Britain and the United States, the last-named furnishing about 16 per cent. Great Britain was by far the largest market for Swedish exports, taking a little more than 20 per cent of the total; the United States was second with about 12 per cent; and Germany was third, with about 10 per cent of the total. American participation in Swedish trade was much larger than in pre-war years. Swedish exports to Soviet Russia in 1924 exceeded the pre-war figure in value.

DISTRIBUTION OF SWEDISH TRADE BY  
PRINCIPAL COUNTRIES  
[In Swedish paper crowns]

Country	Imports	Exports
Germany .....	352,790,000	133,230,000
Great Britain and Ireland .	307,690,000	363,390,000
United States .....	227,290,000	152,810,000
Denmark .....	120,890,000	82,880,000
Holland .....	56,590,000	47,850,000
France .....	44,780,000	92,650,000
Norway .....	38,080,000	54,900,000
Russia .....	4,950,000	43,800,000
Argentina .....	46,550,000	16,660,000

FINANCE. The Swedish budget proposed for 1926-27 showed a balance that was to be attained (even though reductions in the tax rate were proposed) through increases in revenue from state enterprises and in profits from the Riksbank, as well as through draft on cash reserves accumulated in the treasury from past years, and through anticipated loans. There was a tendency towards more extensive assessment of income and property on a progressive scale. The outstanding feature of the 1926-27 budget was a proposed reduction in the rate of taxation on incomes, and reductions in the customs duties on coffee and sugar.

SUMMARY OF SWEDISH BUDGETS  
[In Swedish crowns, gold]

Classification	1925-26 (estimated)	1926-27 (proposed)
<b>Expenditures (ordinary and extraordinary)</b>		
Expenditures proper (current):		
Administrative (ministries, etc.) .....	533,843,100	544,030,600
Unforeseen .....	1,703,622	1,000,047
Cost of Riksdag, audit, etc.	4,254,000	4,263,000
Interest on national debt, etc. ....	82,001,200	84,552,500
Increase of capital (non-recurrent) .....	107,016,778	104,308,153
<b>Total .....</b>	<b>728,818,700</b>	<b>739,154,300</b>
<b>Revenues</b>		
Income proper (current) .	508,318,188	513,878,500
Income from productive funds (non-recurrent) .....	106,342,300	110,162,000
Share in profits of Bank of Sweden .....	15,500,000	16,000,000
Capital assets employed ...	48,052,212	58,996,645
Loans .....	50,606,000	41,117,155
<b>Total .....</b>	<b>728,818,700</b>	<b>739,154,300</b>

On Jan. 1, 1926, the total amount of the funded debt was 1,733,598,000 crowns.

COMMUNICATIONS. On Jan. 1, 1925, the Swedish merchant marine consisted of 2630 vessels, of 1,342,389 gross tons, of which 1304, of 1,217,922 tons, were steam and motor vessels. The vessels entered in 1924 numbered 26,530, of 12,238,646 tons; cleared, 26,632, of 12,330,455 tons. At the end of 1924 the total length of

railways in Sweden was 15,710 kilometers, of which 5836 kilometers belonged to the state.

**GOVERNMENT.** Executive power is vested in the King, who acts through a responsible ministry known as the Council of State, at the head of which is the minister of state or premier; legislative power is in a diet of two chambers, of which the upper has 150 members elected by the legislature of each province; the lower chamber consists of 230 members elected for four years by universal suffrage (including woman suffrage). Women entitled to vote have the right to run for election. The King in 1926 was Gustaf V, born June 16, 1858, who ascended to the throne on the death of his father, Oscar II, Dec. 8, 1907. For the make-up of the lower chamber as a result of the elections of 1924 see preceding YEAR BOOK. The Socialist ministry during 1926 was composed as follows: Premier, Richard Sandler; foreign affairs, Osten Unden; justice, T. Nothin; defense, P. A. Hansson; social affairs, G. Müller; communications, V. Larsson; finance, E. Wigforss; education and ecclesiastical affairs, O. Olsson; agriculture, S. Linders; commerce, C. E. Svensson; ministers without portfolio, K. Levinson and K. J. D. Schlyter.

**HISTORY.** The year was a comparatively quiet one in Sweden. Considerable advancement was made along the lines of arbitration by the negotiation of treaties with Norway, Denmark, Finland, Poland, and Czecho-Slovakia. An interesting event of the year was the visit of Crown Prince Gustavus Adolphus and Crown Princess Louise to the United States. In the last month of the year, Prince William also sailed for the United States, for a lecture tour.

In May, the Social-Democratic government fell, the unemployment issue being the cause. The Popular Party then formed a cabinet, with the following men: Prime Minister and minister of finance, C. G. Ekman; foreign affairs, Erich Loeftgren; justice, J. C. W. Thyren; defense, Senator Rosen; social affairs, Jacob Petterson; communications, M. Zeurling; education, Senator Almkvist; agriculture, Senator Hellstrom; commerce, Feliz Ilamrin. Theoretically, the new government was for Prohibition, although it seemed that it did not have sufficient inherent strength to have such a measure passed. The new prime minister was considered the strongest man in Sweden after the death of Hjalmar Branting (see preceding YEAR BOOK). The new government was welcomed on all sides, with the exception of the Social-Democratic Party and some of the Socialists.

**SWEDENBORGIANS.** See NEW JERUSALEM, CHURCH OF THE.

**SWEDENBORGITE.** See CHEMISTRY, under *Mineralogical Chemistry*.

**SWEDISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**SWEET POTATO WEEVIL.** See ENTOMOLOGY, ECONOMIC.

**SWIMMING.** The swimming of the English Channel by two American naiads was the sensational achievement of the year 1926 in this branch of sport. The first woman to negotiate successfully these treacherous waters was Miss Gertrude Ederle, whose time was 14 hours, 31 minutes. Mrs. Clemington Corson followed, her time being 15 hours, 28 minutes. Miss Ederle's feat was the more notable from the fact that she cut man's best time for the Channel swim

by two hours, although her performance was excelled later in the year. Other long-distance aquatic deeds of note during 1926 were the swimming of the Catalina Island Channel by Walter G. Taber in 13 hours, 27 minutes; the circling of Manhattan Island by Mrs. Lottie Schoemmel and the 14-mile swim from Yonkers to the Battery, New York City, by Phyllis and Bernice Zitenfeld, thirteen-year-old twins, in 6½ hours.

More than 150 new records were established in 1926 in the American Amateur Athletic Union and college and school events throughout the United States, women swimmers accounting for nearly half. Eleven new world marks, which will undoubtedly receive the sanction of the International Amateur Swimming Federation, were set. Chief among these are two performances of Arne Borg, of Sweden, who swam 880 yards in 10 minutes, 38¾ seconds, and 1 mile in 21 minutes, 49¾ seconds. Eric Rademacher, of Germany, established a new world's time of 5 minutes 50¾ seconds for 400 meters, and W. D. Kealoha, of Honolulu, swam 100 meters in 1 minute, 11¾ seconds. Ethel Lackie and Martha Norelius, both of the United States, accounted for seven more world records between them.

The United States national senior outdoor championships for men returned the following winners: 100 meters, John Weissmuller, Illinois A. C., 59¾ seconds; 440 yards, Weissmuller, 5 minutes, 21¾ seconds; 880 yards, Arne Borg, Illinois A. C., 10 minutes, 38¾ seconds; 1 mile, Borg, 21 minutes, 49¾ seconds; high diving, Peter Desjardines, Miami, Fla.; long distance, Clarence A. Ross, New York A. C.

The winners in the senior outdoor women's championship were: 100 meters, Ethel Lackie, Illinois A. C., 1 minute, 14¾ seconds; 440 yards, Martha Norelius, Women's Swimming Association, New York, 6 minutes, 6 seconds; 880 yards, Martha Norelius, 12 minutes, 47 seconds; mile, Ethel McGary, W. S. A., New York; high diving, Esther Foley, W. S. A., of New York.

In collegiate water sports, the swimmers of the United States Naval Academy won at the intercollegiate championships, but Yale's team, which was unable to compete in this fixture, later defeated the midshipmen in a dual meet, in which several new world college records were established.

**SWINE.** See LIVESTOCK.

**SWITZERLAND.** A federated republic of western Europe, comprising within its limits the highest of the Alps and the Jura Mountains. Capital, Berne.

**AREA AND POPULATION.** The area of Switzerland is 15,940 square miles; population, according to the census of 1920, 3,880,320; estimated Dec. 1, 1924, 3,917,800. In 1924 the estimated population of the principal cities was as follows: Zurich, 204,570; Basle, 136,580; Geneva, 127,720; Berne, 105,070. The movement of population in 1924 was: Births, 75,566; deaths, 50,861; marriages, 28,510; emigrants, 4140. Linguistic differences constitute the most important distinction among the various Swiss types. German is the language of 70.9 per cent of the people, French of 21.2 per cent, Italian of 6.2 per cent, and Romansch of 1.1 per cent. Dialects of the various languages are numerous.

**EDUCATION.** The following are the statistics for the various classes of educational institutions for 1923-24: Primary schools, 4412, with

16,896 teachers and 509,762 pupils; secondary schools, 529, with 27,264 boys and 24,920 girls, and 1805 men and 523 women teachers; lower middle schools, 85, with 7242 boys and 4083 girls, and 546 men and 55 women teachers. For special education there are various commercial, technical, agricultural, and other schools. The seven universities of Switzerland, organized on the same plan as the German universities, are given in the accompanying table from the *Statesman's Year Book* for 1926, with the number of students by faculties for 1924-25 and the number of teachers in 1924:

	Theology	Law	Medicine	Philosophy and science	Total	Teaching staff 1924
Basle (1460) . . . . .	64	120	341	592	1,117	154
Zurich (1882) . . . . .	54	572	579	526	1,731	173
Bern (1834) . . . . .	49	516	404	466	1,435	187
Geneva (1559 <sup>a</sup> and 1873 <sup>b</sup> ) . . . . .	27	272	288	269	856	151
Lausanne (1537 <sup>a</sup> and 1890 <sup>b</sup> ) . . . . .	21	190	148	382	741	139
Fribourg (1869) . . . . .	224	136	...	197	557	67
Neuchâtel (1868 <sup>a</sup> and 1909 <sup>b</sup> ) . . . . .	11	77	...	98	186	57

<sup>a</sup> As an academy.

<sup>b</sup> As a university

PRODUCTION. Of the total area, 2,317,243 acres are unproductive; of the productive area, 2,315,482 acres are forest, 3,025,000 acres under grass, and 2,000,000 acres pasturage. The principal crops are wheat, rye, oats, and potatoes. The chief agricultural industries are the making of cheese and condensed milk. Wine is produced in eight of the cantons and tobacco in three. For the estimates of the production of the principal agricultural crops in 1926 see Table of Production by Countries in article AGRICULTURE. The forest area belongs chiefly to the municipalities and is under Federal forest laws.

The following table gives the latest available statistics concerning Swiss industries:

NUMBER OF FACTORIES AND EMPLOYEES IN CHIEF SWISS INDUSTRIES AT END OF 1924

Industries	Factories	Workers
Cotton manufacture . . . . .	843	35,833
Silk manufacture . . . . .	194	28,904
Wool manufacture . . . . .	71	6,964
Linen manufacture . . . . .	29	1,483
Embroidery manufacture . . . . .	880	15,329
Other textile industries . . . . .	153	6,085
Clothing industry . . . . .	884	35,363
Foodstuffs industry . . . . .	621	25,141
Chemicals industry . . . . .	230	12,942
Paper, leather, and rubber manufactures . . . . .	293	12,285
Woodworking . . . . .	501	26,031
Machinery, apparatus, and instrument industries . . . . .	720	61,205
Watchmaking . . . . .	1,099	41,207

COMMERCE. According to the United States Bureau of Foreign and Domestic Commerce. Swiss imports in 1925 were valued at 2,634,158,000 francs (including 159,032,000 francs of unminted precious metals), and exports amounted to 2,038,743,000 francs (including 19,272,000 francs of unminted precious metals). Omitting the trade in precious metals, which was mainly non-commercial, exports were 27,553,000 francs higher and imports 3,685,000 francs higher than in 1924, with a consequent reduction of 23,868,000 francs in the adverse trade balance.

Very few differences appear in the main

groups of Swiss trade, as between 1925 and the previous year.

SWISS FOREIGN TRADE IN 1925  
[In thousand francs\*]

Commodity group	Imports 1925	Exports 1925
Foodstuffs and beverages . . . . .	694,055	192,772
Animals, animal products, and fertilisers . . . . .	73,484	15,929
Hides and skins . . . . .	62,859	68,372
Seeds, plants, etc. . . . .	67,337	1,898
Wood . . . . .	60,196	9,971

Machinery and vehicles . . . . .	148,079	192,546
Watches, clocks and parts; instruments and apparatus . . . . .	84,599	347,534
Chemicals, dyes and industrial oils . . . . .	177,456	180,996
Miscellaneous . . . . .	21,641	8,888
Tobacco . . . . .	17,730	5,883
Total . . . . .	2,634,157	2,038,743

\* The Swiss franc exchanged in 1924 at an average value of \$0.1822; in 1925, at par, or \$0.1933.

FINANCE. Swiss revenues and disbursements during 1925 varied only slightly from the estimates for the year. Ordinary receipts amounted to 298,814,000 francs, a gain of 10,154,000 francs over estimates, while expenditures amounted to 307,974,000 francs, an increase of 2,287,000 over the budget forecast. The resultant deficit was reduced, therefore, to 9,160,000 francs, as against an estimate of 17,027,000 francs. For the year 1926 the ordinary budget still showed a deficit; but this, it was expected, would be more than counterbalanced by an anticipated surplus in the extraordinary budget as a result of heavy yields from extraordinary taxes.

SWISS ORDINARY BUDGETS OF RECENT YEARS  
[In thousand francs]

Classification	1924 (actual)	1925 (estimated)	1926 (proposed)
<b>Expenditures</b>			
Interest . . . . .	120,005	117,000	110,500

Deficit . . . . .	21,607	17,027	1,630

RAILWAYS. Revenues for Swiss railways were less in 1925 than in 1924, declining chiefly because of less freight traffic and the retirement

of steam locomotives following electrification. Despite the adverse factors, however, the railroads were able to balance their accounts for the third time since the War, showing a credit balance of 1,480,000 francs and reducing a deficit incurred during the War to 190,500,000 francs. Approximately 100,800,000 passengers, or 5,300,000 more than in 1924, were carried by the Swiss railways in 1925. The increase in passenger traffic was laid to increased tourist travel. Receipts from this source were about 140,000,000 francs, 7,000,000 more than in 1924 and the highest figure attained in 20 years. Freight revenue, however, diminished by 26,000,000 francs, as compared with 1924, due largely to a reduction in rates, to less long-haul traffic from north to south and from east to west, and to the increased use of motor trucks.

The electrification of its Federal railways is a factor that has contributed largely to the development of the hydraulic resources of Switzerland. During the War it was difficult for the country to secure coal enough at reasonable prices to keep its industries running. In order to gain freedom from this foreign dependence for fuel, a programme for the utilization of hydraulic resources was drawn up, which included the electrification of all the principal lines of the Federal railway system. To furnish power for this purpose, large hydroelectric plants were built at Ritom, Amsteg, Goeschenen, Barberine, and Massaboden. While the construction of these plants was going on, the Federal railways were equipping their most important lines for electric traction. The total length of the electrified lines in 1919 was only 107 kilometers. By the end of 1926 the total length exceeded 1000 kilometers of long lines, on which 250 electric locomotives operated regularly. When the above mentioned programme has been fully realized—in 1929, according to present plans—the length of electrified lines will exceed 1500 kilometers.

**GOVERNMENT.** Both executive and legislative power are vested in a parliament of two chambers; namely, the Council of State and the National Council; the first having 44 members elected by the 22 cantons, two for each canton; the second has 198 members elected directly by the people. The two chambers united form the Federal Assembly, which is the supreme organ of government and delegates the chief executive authority to the Federal Council, whose seven members are elected for three years. The seven members of the Federal Council act as ministers for the departments of government. The chief magistrate is the president of the Confederation, and is elected by the Federal Assembly for one year. President of the Confederation in 1926, Henri Haeblerlin; Vice-President of the Federal Council, Giuseppe Motta.

In the last month of the year the legislature elected Dr. Giuseppe Motta, president, and Edmund Schulthess, vice-president of the republic, for the year 1927. Dr. Motta served as president in 1915 and again in 1920. During 1926 he was vice-president. M. Schulthess was president in 1917, and during 1926 he was the chief of the department of public economy.

**SYMPHONY CONCERTS.** See MUSIC.

**SYRACUSE UNIVERSITY.** A non-sectarian, coeducational institution of the higher education at Syracuse, N. Y.; founded in 1870. The 1926 fall enrollment was 5358, and the

summer session had a registration of 1373. The faculty numbered about 550. The productive funds of the institution amounted to \$2,745,406, and the income for the year to \$1,352,000. The library contained 150,876 volumes and over 60,000 pamphlets. Chancellor, Charles Wesley Flint, M.A., D.D., Paed.D., LL.D.

**SYRIA.** Traditionally, the region lying between the Syrian desert and the Euphrates River, on the east, and the Mediterranean on the west; and between the Taurus Mountains in the north, and Egypt on the south; formerly a province of the Turkish Empire; in 1920 recognized as an independent state under a mandatory power, the mandate being bestowed upon France. Syria, under the mandate, is bounded by the Mediterranean on the west, by Palestine on the south, by Mesopotamia on the east, and by Turkey on the north. Since Jan. 1, 1925, the country comprises four territories, Syria, Alaouite, Great Lebanon, and Jebel Druze. The total area of the mandated region has been placed at 60,000 square miles, and the population at less than 3,000,000. Arabic is the prevailing language, the great majority of the inhabitants being of Arabic stock, and, in religion, Sunnite Mohammedan. The chief towns are Damascus, 170,000; Aleppo, 140,000; Beirut, 80,000; Homs, 60,000; and Hama, 35,000. There are about 500 French schools, with 50,000 pupils. Various educational schools are maintained by the Greek Catholics, the Maronites, the British missionary societies, and Roman Catholic agencies. There is an American university at Beirut, with 934 students in 1923-24.

**PRODUCTION.** Syria is essentially an agricultural country, and under the mandatory government efforts have been made to encourage the adoption of improved agricultural methods. Although the cultivable area of the country is estimated at about 12,500,000 acres, only about one-fifth of that total was actually under cultivation in 1926. Cereals, vegetables, and fruits are the leading crops, and some tobacco, cotton, and hemp also are produced. The wheat crop in 1925 was estimated at its average size of approximately 1,000,000 tons, and the barley and durra crops at about one-fourth or one-third the size of the wheat crop. In spite of the large acreage planted, the total cereal yield is still insufficient for the needs of the country. Considerable acreage is devoted to vineyards. The greater part of the crop is used for wine or alcohol, but additional quantities of alcohol are imported from Europe. Lemons, bananas, and oranges ordinarily constitute very profitable crops in Syria, but during the past two years the fruit trees have been attacked by pests, and many of the groves have been damaged, and the quality of the fruit has deteriorated in certain districts. For many years, silk culture has been very important in Syria, particularly in the Lebanon, where the majority of the mulberry trees are located. The yield of cocoons in 1924 was estimated at 6,118,000 pounds. Sheep raising is widespread throughout the country. Industries are little developed. The mineral resources, which are practically undeveloped, include iron, lignite, petroleum, phosphates, lead, copper, antimony, nickel, chrome, and marble.

**COMMERCE.** In spite of the disturbed conditions in the Damascus area during the last quarter of 1925 (see the preceding YEAR BOOK),

Syrian total trade for the year showed a noticeable increase, exports being 25 per cent greater than in 1924 and imports 11 per cent greater. It is evident that the year 1925 would have shown quite remarkable commercial and economic progress if the insurrection at the end of the year had not interrupted the important reexport trade across the Damascus region. The leading commodities entering into the import, export, and reexport trade of Syria, as given in that country's official statistics, are shown in the accompanying table:

SYRIA'S FOREIGN TRADE  
[In thousand Syrian pounds \*]

Article Imports	1924	1925
Cotton and cotton goods . . . . .	10,681	12,187

Equivalent in thousands of dollars . . . . .	17,796	21,853

\* The Syrian pound exchanged in 1924 at \$1.047; in 1925 at \$0.953.

**FINANCE.** The revenue for 1924 was 10,606,279 Syrian pounds, and the expenditure was 7,458,155 Syrian pounds.

**COMMUNICATIONS.** The following railways were open in 1925: From Beirut to Damascus, 91 miles; Rayak to Aleppo, 206 miles; Homs to Tripoli, 64 miles; Beirut to Mameltein, 11 miles; and Damascus to El Hammé, 120 miles.

**HISTORY.** At the beginning of the year the situation in Syria was still very serious, and the impression seemed to prevail that the appointment of High Commissioner Jouvenel in place of General Sarrail would not go very far toward solving the difficulties. On January 3, Jouvenel issued a proclamation to the Druses requesting them to lay down their arms and meet the French government around the conference table to settle the points of friction. The Druses a few weeks later presented a note from Sultan Atrash requesting a peace conference. Not wishing to give the tribes the status of a belligerent, Jouvenel refused the request until the Druses should lay down their arms. In the meantime, desultory fighting continued, and railway communication between Damascus and Beirut was continually interrupted. Early in March, the Druse assembly made a series of demands on the French which practically asked for complete independence and the withdrawal of the French from the country. This was met

by Jouvenel with the statement that further negotiation was impossible, and the only terms on which he would discuss the situation with the natives would be those of unconditional surrender. His policy was followed up in April by a military movement in force against the Druses. This aimed at disarming all soldiers or driving them into Palestine or the desert. The city of Damascus suffered from another bombardment May 7, and business came to a virtual standstill, because the outskirts of the city were held by the natives and the city proper by the French. The Syrians fought a regular guerilla warfare, attacking small French bands, disorganizing communications, and always evading a frontal attack. Generally speaking, the French were able to hold the cities, but were incapable of making any headway in the rural districts. Many observers stated that it would take 100,000 French troops and a large sum of money to bring about pacification, and then it would only exist as long as the army was in control. The reports of the military operations in Syria were very difficult to interpret, those from French sources speaking of glowing victories, while those of the Syrians concerning the same engagement told almost an opposite story. The French censorship was so strict that impartial or hostile news had no opportunity to reach the outside world.

Early in October, Jouvenel was succeeded in the position of High Commissioner by Auguste Henri Bonsot, who announced that he had made a thorough study of Syrian conditions and that he was open to any reasonable proposal for settlement of the difficulties. His arrival was followed by a lull in the military operations, apparently because the Druses wished to hear his point of view concerning the affairs of the mandate. Shortly afterwards he opened negotiations with the Druse chiefs, but nothing was accomplished by the close of the year. See LEAGUE OF NATIONS.

**TACNA-ARICA ARBITRATION.** See ARBITRATION, INTERNATIONAL.

**TAHITI.** See OCEANIA, FRENCH ESTABLISHMENTS IN.

**TAIWAN,** t'í-wán'. Official Japanese name for Formosa (q.v.).

**TALC AND SOAPSTONE.** The mining and preparation of talc and soapstone in 1926 were of about the same volume as in 1925, when 5684 short tons of the crude material, valued at \$24,533, were produced, with sawed and manufactured talc to the amount of 895 short tons, valued at \$107,691, and ground material to the amount of 175,677 short tons, valued at \$1,879,569; making a grand total of 182,256 short tons, valued at \$2,011,793. The principal producing states were Vermont and New York, the latter supplying a fibrous talc whiter in color and bringing a higher price than the Vermont material. California produces the finer grades of talc, and also some block talc. Soapstone is sawed into slabs and manufactured into laundry tubs, laboratory table tops, and other products, as well as being used in rough blocks or the crude state. In Europe, the principal producers were the French mines, which in 1926 were said to have combined with Italian mines in increased exports to the United States. The imports of talc, steatite, and French chalk in 1926 totaled 48,692,369 pounds, valued at \$563,799, as against 41,980,365 pounds, valued at \$449,338, in 1925.

**TANGANYIKA** (tân'gân-yê'ká) **TERRITORY.** A territory under British mandate, comprising the portion of German East Africa assigned to Great Britain after the conquest of the country by British and Belgian soldiers during the World War. Area, about 365,000 square miles; native population (mainly of mixed Bantu race), according to the census of 1921, 4,107,000. The Europeans numbered 2447; Asiatics, 14,991, of whom about two-thirds were Indians. Capital, Dar-es-Salaam, with a population of 25,000. The capital and Tanga are the chief seaports. In 1924 there were 73 government schools, 1576 Roman Catholic schools, and 1026 Protestant schools, with a total roll exceeding 167,634 pupils.

The total area under forest is approximately 2,700,000 acres, of which 2,170,000 acres are included in the government forest reserves. Ebony, gum copal, and wild rubber are found. The chief agricultural products are cereals, manioc, peas and beans, groundnuts, oil products, sweet potatoes and other vegetables, fruits (chiefly bananas), and coffee. Sisal and cotton production are also important industries. The output of cotton in 1924-25 was estimated at 6,800,000 pounds. A livestock census taken in 1924 showed 3,808,284 cattle and 3,943,618 sheep and goats. The principal minerals found are coal, gold, mica, graphite, iron and copper ores, cobalt, and nickel. The total imports in 1924 were valued at £2,062,546; exports, £2,695,284; transit trade £603,094. The principal imports consisted of cotton piece goods, foodstuffs, building materials, iron and steel manufactures, machinery, kerosene and gasoline, cigarettes, and liquors. The principal exports were sisal, cotton, groundnuts, coffee, hides and skins, copra, grain, sisimim, beeswax, ghee, and chilies. The revenues in 1925 amounted to £1,558,982 and the expenditures to £1,747,578. In 1924, 399 steamers (exclusive of coastal boats) of 1,487,836 tons, and 3716 dhows of 69,800 tons, entered and cleared from the various coast ports from places beyond the territory. The railways include the Tanga line of 219 miles; Central Railway, 772 miles; and the Voi-Kahe railway, 92 miles. The last named railway has been taken over by the Kenya government.

The head of the administration is a governor, who is aided by a nominated executive council. Governor in 1926, Sir D. C. Cameron.

**TANNING MATERIALS.** See **CHEMISTRY, INDUSTRIAL.**

**TANTALUM.** See **CHEMISTRY, INDUSTRIAL.**

**TARDIVEAU, RENÉ.** See **BOYLESVE, RENÉ.**

**TASMANIA.** A state of the Australian Commonwealth, consisting of the island of that name and several small islands. Area, including the island of Macquarie (170 square miles), 26,215 square miles; population, according to the census of 1921, 213,780; estimated in 1925, 214,336. The movement of population in 1924 was: Births, 5383; deaths, 2123; marriages, 1529. Capital, Hobart, with a population including suburbs (Mar. 31, 1925), of 55,600. The population of Launceston, including suburbs, on the same date was 27,320.

The agricultural produce in 1923-24 was: Wheat, 305,620 bushels; oats, 1,350,785 bushels; peas, 474,621 bushels; potatoes, 99,996 tons; hay, 144,298 tons; fruits, 2,418,830 bushels; and hops, 2,293,000 pounds. The value of agricultural and pastoral products was £5,628,040;

mining products, £1,325,958, and manufactures, £4,019,989. The chief minerals in order of value were copper, tin, lead, silver, zinc, coal, gold, and osmiridium. The two chief sources of manufactured exports are fruit-preserving and metal extraction. The imports in 1924-25 were valued at £8,814,460; exports, £8,848,173. The principal exports are wool, minerals, timber, fruit, grain, potatoes, hops, bark, and hides and skins. The total registered shipping amounted to 185 vessels, of 16,761 tons. On June 30, 1924, Tasmania had 673 miles of railway open to traffic. The Tasmanian Railways again showed a deficit during the year ended June 30, 1926. For this period the revenue was £542,190, compared with £545,255 for the previous year, a decline of £3065. The poor showing of the railroads is attributed to motor competition, and it has been suggested that busses be prohibited from carrying passengers on roads parallel to railways.

The administration is under a governor, who acts through a responsible ministry, and the legislative power is vested in a parliament of two houses: namely, the Legislative Council of 18 members, elected on the basis of property qualification, and the House of Assembly of 30 members, elected for three years by universal suffrage, including women, and with proportional representation. Governor in 1926, Sir James O'Grady; prime minister, treasurer, and minister for mines, J. A. Lyons.

**TAXATION.** In the United States the Revenue Bill, which was the result of the efforts of the Conference Committee of the Senate and the House of Representatives, passed both houses by large votes early in the year, and was signed by President Coolidge February 26. This bill aimed to reduce the taxpayers' burden and to secure simplification of taxation. The law as passed reduced the inheritance taxes, decreasing the maximum from 40 to 20 per cent, allowed a credit of 80 per cent on inheritance taxes paid to a State, raising the credit from the 25 per cent of the former act. The exemption of estates from the Federal tax was increased from \$50,000 to \$100,000, and a further cut was made by the application of the lower rates of the Revenue Act of 1921 in place of the higher rates of the Act of 1924. In the income tax schedules, the surtax rate on incomes between \$26,000 and \$100,000 was reduced, and the personal exemption of single persons was raised from \$1000 to \$1500 and of married persons from \$2500 to \$3500. The normal tax rates were reduced from 2 to 1½ per cent on the first \$4000 of taxable income, from 4 per cent to 3 per cent on the next \$4000, and from 6 per cent to 5 per cent on the remainder. The corporation tax was increased from 12½ per cent to 13 per cent for the year 1927, and 13½ per cent thereafter. The tax on admissions and dues was retained, with the ticket exemption raised from 50 to 75 cents. The tax on passenger automobiles, with the rate reduced from 5 per cent to 3 per cent, was kept, but the tax on automobile trucks was removed. The gift tax enacted in 1924, and which imposed the estate tax rates on gifts among the living, was repealed. The law abolished a considerable number of miscellaneous excise or occupation taxes, including those on automobile tires and parts, jewelry, cameras, ammunition and firearms, billiard and pool tables, and other means of amusement, and stamp taxes on deeds and other legal documents. The only new tax in the

act was one of one-tenth of a cent per gallon on beverages made from cereals.

During the fiscal year 1926 the United States Internal Revenue Bureau collected taxes aggregating \$2,835,999,892.19, as compared with \$2,584,140,286.24 in 1925, or an increase of \$251,859,823.95, or 9.7 per cent. Income and profit taxes supplied the greater part of the revenues collected by the Government. The income tax collections for the fiscal year amounted to \$1,974,104,141.33, as compared with similar collections in the fiscal year 1925 amounting to \$1,761,659,049.51, an increase of \$212,445,091.82, or 12.1 per cent. The collections for the fiscal year 1926 included payments of the third and fourth installments of the tax due on incomes in the calendar year 1924, together with additional collections made for the prior year amounting to \$844,649,733.47, as compared with \$780,804,647.05 representing payments of income tax for the corresponding period of the fiscal year 1925, an increase of \$64,045,086.42, or 8.2 per cent. During the last six months of the fiscal year 1926 the first and second installments of the taxes due on incomes in the calendar year 1925 were collected, together with additional collections on assessments made for prior years amounting to \$1,129,454,407.86, compared with \$981,054,402.46 for the corresponding period of the fiscal year 1925, or an increase of 15.1 per cent. The tax on the returns of net income of individuals and corporations filed for the year 1924 was at the rates provided for in the revenue act of that year, while the tax on the returns of net incomes filed for the year 1925 was at the rates provided in the revenue act of 1926.

Under miscellaneous taxes collected by the Internal Revenue Bureau, the principal increase was on tobacco manufactures, amounting to \$25,419,227.91, although substantial reductions were made in the rate of tax on all classes of cigars, which, however, did not become effective until Mar. 29, 1926. The collections on passenger automobiles and motorcycles, on which the tax was reduced from 5 to 3 per cent in the revenue act of 1926, also showed an increase for 1926 amounting to \$18,990,978.14. Decreases for 1926 were shown in the collections from all other excise taxes which were repealed by the revenue act of 1926, effective February 26 of that year.

The Office of Internal Revenue reported that the income tax collections for the calendar year 1926 amounted to \$2,172,127,321, as compared with \$1,825,704,135 for the calendar year 1925. Of the 1926 collections, \$1,256,793,285 was from corporations and \$915,334,035 from individuals. Of the 1925 collections, \$956,268,218 was from corporations and \$869,435,917 was from individuals. New York was first in the amount of collections in 1926, the total amounting to \$618,415,054, of which \$276,299,217 was from corporations and \$342,115,836 from individuals. Pennsylvania ranked second with a total of \$213,418,954, of which \$130,040,325 was from corporations and \$83,378,629 from individuals. Illinois was third with income tax collections in 1926 amounting to \$192,101,247, of which \$114,267,679 was from corporations and \$77,833,567 from individuals. Florida, with total collections amounting to \$46,678,668, showed a notable increase over 1925, when the total was \$16,803,149. Of the 1926 Florida collections, \$17,679,748 was from corporations and \$28,998,920 from

individuals. The collections for Maryland, which included the District of Columbia, in 1926 totaled \$44,548,154, of which \$25,339,377 was from corporations and \$19,208,777 from individuals.

An important tax reform that was making progress was in connection with taxing estates of non-residents. By 1926, as the result of recent legislation, New York, Pennsylvania, Connecticut, and Massachusetts had enacted reciprocity statutes providing that the respective states would not tax the estates of residents of other states on intangible personal property if such other states did not tax its residents' estates. In the spring of 1926 the State of New Jersey repealed its tax on the intangible personal property of non-residents. In this connection it was stated that the States of Alabama, Nevada, and Florida had no inheritance tax at all, while the States of Georgia, Rhode Island Tennessee, and Vermont had not attempted to impose a tax on intangible personal property of non-residents. In other words, 12, or one-fourth, of the States of the Union in 1926 did not tax the residents of the other States on intangible personal property passing at death.

**TELEGRAPHY.** Telegraph engineering, on both land and submarine cable circuits, furnished notable developments in greater efficiency of service and faster transmission. A cable connecting New York and London that would allow a rate of transmission eight times as fast as any in use between those points was laid during the year. The main feature of this cable was its wrapping or loading with permalloy, an alloy of iron and nickel of high magnetic permeability. It was laid between Bay Roberts, Newfoundland, and Penzance, England, and had a capacity of 2500 letters per minute. During the year, All America Cables, Inc., laid 788 miles of cable and was preparing to lay a third cable from Cuba to the Canal Zone and from Callao, Peru to Valparaiso, Chile. Upon completion of work under way at the close of the year, this company would have 31,800 miles of cable in operation, including three duplexed cables between New York and Buenos Aires.

The Western Union Telegraph Company reported that it had, at the beginning of the year, 213,763 miles of pole lines; 1,603,760 miles of wire, of which 56 per cent was of copper; 3176 miles of land line cables; 25,476 nautical miles of ocean cables; 24,428 telegraph offices, and that it employed about 63,000 persons.

**TELEPHONY.** The great industrial activity and its consequent expansion of office and residence demand that characterized the year resulted in all telephone facilities being heavily taxed to supply the necessary service. The American Telephone & Telegraph Co. reported that at the close of 1926 there were more than 17,600,000 interconnected stations of the Bell System; and of these about 2,000,000 were machine switching stations. In order to provide the facilities that were indicated as needed in the immediate future, the American Telephone & Telegraph Co., in June, increased its capital stock by approximately \$154,000,000. New central offices, buildings for housing the executive and business departments of so extensive a utility and the construction of new wire and cable lines were some of the undertakings requiring the outlay of almost \$400,000,000 during the year.

By the end of 1926, there had been more than

1800 miles of toll cable added to the Bell System. The New York-Chicago long distance cable was extended to St. Louis, a distance of 344 miles. This new cable cost \$7,000,000 and was more than two years in construction. It provided about 250 telephone channels and several hundred telegraph channels and contained circuits for short-haul toll traffic as well as through circuits connecting St. Louis with Chicago, New York, Boston and Washington. The longest circuits of the network were 1500 miles in length, but tests demonstrated that longer circuits of conductors similar to this could be operated satisfactorily.

Approximately 65,000 miles of carrier current channels were added to the Bell System during the year, for both telephone and telegraph; and tests of the carrier current principle for relatively short toll circuits were being conducted. The carrier current principle was applied also to submarine cables 26 miles long between Catalina Island and the California mainland. In addition to the normal voice frequency channel, six carrier current channels were superimposed on a single cable. Carrier frequencies ranged up to about 26,000 cycles.

It was announced that a direct telephone line between New York City and Mexico City would be opened early in 1927, the American Telephone and Telegraph and the International Telephone and Telegraph Companies coöperating to furnish the service. The length of the line would be almost 3000 miles, running from New York to Laredo, Texas, thence across the Rio Grande to Nueva Laredo in Tamaulipas, from which point it would reach Mexico City via Tampico.

In Europe, the Compañía Nacional de España completed at the close of the year a telephone system that connected stations 3800 kilometers apart. This was the longest European circuit in use and in addition to lines in Spain, it crossed the Strait of Gibraltar by cable to points in Africa.

**TEMPLE UNIVERSITY.** An institution of higher learning at Philadelphia, Pa.; founded in 1884. The 1926 fall term enrollment was 7774, distributed as follows: Liberal arts and sciences, 613; teachers college, 2669; elementary school, 97; commerce, 2283; theology, 26; law, 387; medicine, 215; pharmacy, 265; dentistry, 481; music, 176; chiropody, 26; university high school, 461; training school for nurses, 75. The summer school registration for 1926 was 952. There were 528 members on the faculty. The income for the year was \$1,042,574. Ground was secured during the year for a new Medical School building, and plans drawn for a greater University. The library contained 37,019 volumes. The vacancy occasioned by the death of President Conwell in 1925 was filled by the election of Charles E. Beury, LL.D.

**TENNESSEE. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,337,885. The estimated population on July 1, 1926, was 2,468,000. The capital is Nashville.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	3,099,000	85,222,000	\$56,247,000
	1925	3,162,000	83,240,000	56,284,000

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1926	1,178,000	475,000 <sup>a</sup>	
	1925		517,276 <sup>a</sup>	
Hay, tame	1926	1,297,000	1,684,000 <sup>b</sup>	27,124,000
	1925	1,162,000	1,069,000 <sup>b</sup>	23,518,000
Tobacco	1926	187,000	106,997,000 <sup>c</sup>	10,058,000
	1925	180,000	94,380,000 <sup>c</sup>	16,045,000
Potatoes	1926	35,000	2,780,000	4,286,000
	1925	37,000	2,072,000	4,040,000
Sweet potatoes	1926	45,000	5,535,000	3,874,000
	1925	36,000	3,240,000	4,536,000
Wheat, winter	1926	394,000	7,092,000	9,645,000
	1925	367,000	4,588,000	7,616,000
Oats	1926	287,000	7,175,000	3,946,000
	1925	221,000	4,862,000	3,112,000

<sup>a</sup> bales, <sup>b</sup> tons, <sup>c</sup> pounds.

**MINERAL PRODUCTION.** Coal, the State's leading mineral in point of value of annual product, rose in production to 5,736,146 short tons in 1925 from 4,556,555 short tons in 1924; and to a value of \$10,585,000 in 1925, from \$9,711,000 in 1924. Cement was the second mineral product in order of value in 1924, followed by clay products and stone. The clay products of 1924 had a total value of \$4,933,152; those of 1923, \$4,879,848. Stone production was 1,437,280 short tons in 1924 and 1,454,180 short tons in 1923; in value, \$3,867,072 in 1924 and in 1923, \$4,341,393. There were shipped in 1925 from the mines of the State 164,073 long tons of iron ore, and in 1924, 179,293 long tons; in value, \$369,144 in 1925 and in 1924, \$431,682. Pig iron production declined to 95,186 long tons in 1925 from 126,660 long tons in 1924; and to a value of \$2,014,176 in 1925 from \$2,782,154 in 1924. Copper production increased in 1925, the State's smelter output being 19,789,234 pounds in 1925 and 18,251,996 pounds in 1924. Copper production was valued in 1924 at \$2,401,968. Phosphate rock was produced to the quantity of 388,697 long tons in 1924 and 415,711 long tons in 1923; and to the value of \$1,976,188 in 1924 and in 1923, \$2,255,040. Lime, ferro-alloys, and sand and gravel were produced in important quantities. The total value of the State's mineral products, duplications excluded, was in 1924, \$35,354,525; in 1923, \$41,553,780.

**FINANCE.** As summarized by the United States Department of Commerce, payments for maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$13,037,609. Their rate per capita was \$5.39, as against \$4.70 in 1924 and \$2.60 in 1917. Their total included \$3,319,322 for education, apportioned among the minor State divisions. Payments amounting to \$804,913 for interest on debt, and \$9,621,750 for permanent improvements, added to the payments for maintenance and operation of State departments, made the total of State payments \$23,464,272. For highways was expended the sum of \$11,601,454, of which \$3,102,521, representing a material increase, was for maintenance, and \$8,498,933 was for construction.

Revenue receipts of the State were \$21,663,740, or \$8.96 per capita. They exceeded by \$7,821,227 the total payments except those for permanent improvements, and were \$1,800,523 less than the total with these included. Payments in excess of revenue were met from the proceeds of debt obligations. Property and special taxes formed 27.4 per cent of the revenue in 1925, as against 35.1 per cent in 1924 and 49 per cent in 1917. Their per capita rate was \$2.46 in 1925, \$2.73 in 1924 and \$1.38 in 1917. Earnings of the departments and compensation

for officials' services furnished 11.4 per cent of the 1925 revenue; business and non-business licenses, 38.8 per cent. License revenue included that from taxes on incorporated companies, on sales of gasoline and on motor vehicles. The net indebtedness of the State on June 30, 1925, was \$17,077,176, or \$7.07 per capita, as against a per capita rate of \$7.19 in 1924 and \$6.96 in 1917. The assessed valuation of property subject to State tax was \$1,661,478,404. The State tax levy was \$4,984,435, or \$2.06 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 4063, the trackage of switching and terminal companies excepted. No new construction and no abandonments of line were reported in 1926.

**EDUCATION.** Under the law of 1925, affording State aid to enable all elementary schools to keep open for 8 months each year, 77 out of 95 counties ran their elementary schools for the approximate 8-month period in the school year 1925-26. P. L. Harned, State commissioner of education, as quoted in the *Journal of the National Education Association*, expressed his belief that in the ensuing school year all counties would thus operate. Sixty per cent of the teachers of the State took summer courses in approved institutions, in order to improve themselves. The average annual term of service for teachers was lengthened from 132 to 147 days. For the school year ending June 30, 1926, the total enrollment was 653,876; that in elementary schools, 603,252; and that in high schools, 50,624. Daily attendance in elementary schools averaged 411,653; in high schools, 41,576. Expenditures were: For county elementary schools, \$8,724,155; for county high schools, \$2,915,946; for city schools, \$8,241,325. Salaries averaged, for county elementary teachers, \$564; for county high school teachers, \$1152; for city teachers, \$1122.

**CHARITIES AND CORRECTIONS.** Chief among the State charitable and correctional institutions in 1926 were two State prisons, a girls' vocational school, three hospitals for the insane, schools for the deaf and dumb and a Home for Confederate Veterans.

**POLITICAL AND OTHER EVENTS.** At the election November 2, Governor Austin Peay, Democratic candidate, was reelected for the two-year term beginning January, 1927. He defeated Walter White, Republican candidate, noted as former prosecutor in the Scopes case. Two Republicans and 8 Democrats were elected to seats in the United States House of Representatives. The vote cast was exceptionally light in proportion to registration. John F. Nolan was elected State treasurer by the legislature, and L. D. Smith was elected attorney-general.

A conference on the development of Southern university education was held at Nashville, February 1, by editors from various parts of the South. Counsel for John Thomas Scopes, convicted in 1925 at Dayton, Tenn., of violation of the State act against teaching evolution, offered arguments on appeal with the Supreme Court of the State in January. The court did not make final disposal of the Scopes case during the year. To deal with the excess of cotton brought on the market by the heavy 1926 crop, there met at Memphis in October an All-South Cotton conference, which appointed a permanent committee to effect coöperative withdrawal from the market of 4,000,000 bales, and

to effect reduction in cotton acreage in 1927 to 75 per cent of the 1926 total, through bankers' influence on the planters.

**OFFICERS.** Governor, Austin Peay; Treasurer, Hill McAlister; Comptroller, Edgar Graham; Secretary of State, Ernest Haston; Auditor, O. S. Shannon; Attorney-General, Frank M. Thompson; Commissioner of Education, P. L. Harned.

**JUDICIARY.** Supreme Court: Grafton Green, Chief Justice; Associate Justices, A. W. Chambliss, Colin P. McKinney, Frank P. Hall, William L. Cook.

**TENNESSEE, UNIVERSITY OF.** A non-sectarian, coeducational institution of higher education at Knoxville, Tenn., with colleges of medicine and dentistry and a school of pharmacy at Memphis; founded in 1794. The autumn enrollment for 1926 was 2303, and 1159 were registered in the 1926 summer school. There were 308 members in the faculty. The land grant amounted to \$400,000, and the income for the year 1925-6 to \$2,212,841.54. The library contained 78,556 volumes. New buildings erected during the year were: anatomy laboratory building at Memphis, costing, with equipment, \$319,000; home economics laboratory, costing \$214,000, with equipment; practice house for the department of home economics, at a cost of \$16,000; two experiment stations, one insectary and the other an addition to the dairy cottage of the Middle Tennessee Experiment Station, costing \$1062 and \$870.69, respectively. President, Harcourt A. Morgan, LL.D.

**TENNIS.** The 1926 lawn tennis season was crowded with sensational happenings, the chief among them being the overthrow of William T. Tilden, 2d, as United States national singles champion, by René Lacoste, of France, after a reign of six years. Other noteworthy events were the surprising comeback staged by Mrs. Molla Mallory in winning the United States women's title, the thrilling match won by Mlle. Suzanne Lenglen of France from Miss Helen Wills of the United States on the Riviera, and, finally, the desertion of the amateur ranks by Mlle. Lenglen, Miss Mary K. Browne, and Vincent Richards, Howard Kinsey, Harvey Snodgrass, and Paul Feret of France, who played in the United States.

The United States successfully defended the Davis Cup, emblematic of the world's team championship, defeating France in the challenge round, played at Philadelphia, 4 matches to 1. The scores of the various matches follow:

W. M. Johnston (U. S.) defeated René Lacoste (France), 6-0, 6-4, 0-6, 6-0; W. T. Tilden, 2d. (U. S.) defeated Jean Borotra (France), 6-2, 6-3, 6-3; W. M. Johnston defeated Jean Borotra, 8-6, 6-4, 8-6; René Lacoste defeated W. T. Tilden, 2d., 4-6, 6-4, 8-6, 8-6; R. Norris Williams and Vincent Richards (U. S.), defeated Henri Cochet and Jacques Brugnon (France) 6-4, 6-4, 6-2.

Twenty-four nations took part in the Davis Cup contests, nineteen in the European zone and five in the American zone. France won the European final round, and Japan won the American final. France then defeated Japan in the interzone final, 3 matches to 2, the scores being as follows:

Cochet (France) defeated S. Tawara (Japan), 1-6, 4-6, 7-5, 6-3, 6-2; T. Harada (Japan), defeated Lacoste (France), 6-4, 4-6, 6-3, 9-7;

Lacoste defeated Tawara, 6-1, 6-3, 6-2; Harada defeated Cochet, 6-1, 6-3, 6-4; Brugnon and Cochet defeated Tawara and Harada, 6-0, 6-2.

The Wightman Cup matches, played at Wimbledon, England, resulted in a victory for the United States women's team by a score of 4 to 3. The results follow: Miss Elizabeth Ryan (U. S.), defeated Miss Joan Fry (England), 6-1, 6-3; Mrs. L. A. Godfree (England), defeated Miss Mary K. Browne (U. S.), 6-1, 7-5; Miss Fry defeated Miss Browne, 3-6, 6-0, 6-4; Mrs. Godfree defeated Miss Ryan, 6-1, 5-7, 6-4; Mrs. Marion Jessup (U. S.), defeated Mrs. Shepherd-Barron (England), 6-1, 5-7, 6-4; Mrs. Jessup and Miss Eleanor Goss (U. S.), defeated Mrs. Chambers and Mrs. Barron (England), 6-4, 6-2; Miss Browne and Miss Ryan defeated Mrs. Godfree and Miss Collyer, 3-6, 6-2, 6-4.

The holders of the various United States championship titles at the close of 1926 were: Singles, René Lacoste; doubles, R. Norris Williams and Vincent Richards; women's singles, Mrs. Molla Mallory; doubles, Miss Elizabeth Ryan and Miss Eleanor Goss; clay court singles, William T. Tilden, 2d; doubles, L. N. White and L. L. Thalheimer; indoor singles, René Lacoste; indoor doubles, Tilden and Fred C. Anderson; intercollegiate singles, Edward G. Chandler; University of California; doubles, Chandler and Thomas Stow, University of California. The career of Miss Helen Wills, former woman champion of the United States, was interrupted by illness.

The Wimbledon men's singles was won by Jean Borotra of France and the doubles by Henri Cochet and Jacques Brugnon of France. The Wimbledon women's singles were captured by Mrs. L. A. Godfree of England and the doubles by Miss Elizabeth Ryan and Miss Mary K. Browne of the United States.

**TEXAS. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 4,663,228. The estimated population on July 1, 1926, was 5,313,000. The capital is Austin.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1926	18,363,000	5,900,000	
	1925		4,165,374	
Corn	1926	3,844,000	106,868,000	\$64,118,000
	1925	2,957,000	25,134,000	27,647,000
Wheat, winter	1926	1,802,000	82,798,000	39,355,000
	1925	819,000	6,552,000	10,156,000
Grain sorghums	1926	1,788,000	48,278,000	26,552,000
	1925	1,625,000	30,875,000	23,465,000
Hay, tame	1926	891,000	1,240,000	14,880,000
	1925	804,000	748,000	14,081,000
Potatoes	1926	30,000	2,100,000	3,885,000
	1925	26,000	1,378,000	3,307,000
Sweet potatoes	1926	92,000	8,556,000	8,128,000
	1925	84,000	6,132,000	8,707,000
Oats	1926	1,964,000	83,666,000	81,793,000
	1925	1,091,000	18,419,000	8,454,000
Rice	1926	166,000	6,142,000	6,756,000
	1925	168,000	6,216,000	9,262,000
Barley	1926	220,000	7,700,000	4,081,000
	1925	116,000	835,000	752,000

\* tons.

**MINERAL PRODUCTION.** One of the leaders in the production of petroleum, the State derives from this source much the largest part of its yearly mineral production, in point of value. Production of the State rose to 142,618,000 bar-

rels in 1925, from 134,522,000 barrels in 1924; and to a value of \$262,000,000 (estimated) in 1925, from \$203,870,000 for 1924. Natural gas was produced to the amount of 107,247,000 M cubic feet in 1924 and 74,535,000 M cubic feet in 1923; and to a total value of \$13,748,000 in 1924 and in 1923, \$11,320,000. Gasoline produced from natural gas totaled 184,700,000 gallons in 1925 and 186,571,000 gallons in 1924; in value, \$20,650,000 (estimated) in 1925 and in 1924, \$14,460,000. Cement production was 4,806,000 barrels in 1925 and in 1924, 4,565,983 barrels. Cement shipments attained a value of \$9,440,000 in 1925 and \$8,322,658 in 1924. Clay products totaled \$5,469,908 in 1924, as against \$5,572,665 in 1923. Asphalt derived from oil yielded 240,903 short tons in 1924 and 243,179 short tons in 1923; having a value for 1924 of \$4,127,663 and for 1923 of \$3,781,552. Stone, sand and gravel, gypsum, and coal were produced in important quantities. The total value of the State's mineral product in 1924, duplications excluded, was \$272,729,023; in 1923, \$260,450,913.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State in the fiscal year ending Aug. 31, 1925, were \$55,165,298. Their rate per capita was \$10.88, as against \$7.92 in 1924 and \$4.59 in 1917. Their total included \$23,187,766 for education, apportioned among the minor State divisions. Payments amounting to \$220,051 for interest on debt and \$13,960,603 for permanent improvements, added to the payments for maintenance and operation of departments, made the total of the year's payments \$69,345,952. For highways was expended the sum of \$20,979,760, of which \$10,040,879 was for maintenance and \$10,938,881 for construction. The State assumed in 1925 the entire expense of current highway maintenance, and granted larger apportionments for education.

Revenue receipts of the State were \$64,675,016, or \$12.75 per capita. They exceeded by \$9,289,667 the total payments except those for permanent improvements, and were \$4,670,936 less than the total with these included. Property and special taxes formed 42.5 per cent of the revenue in 1925, as against 44 per cent in 1924 and 56.6 per cent in 1917. Their rate per capita was \$5.42 in 1925, \$5.37 in 1924 and \$3.10 in 1917. Earnings of the departments and compensation for officials' services furnished 5.2 per cent of the revenue in 1925; business and non-business licenses, 33.7 per cent. License revenue was derived chiefly through taxes on incorporated companies, on sales of gasoline and on motor vehicles. The net indebtedness of the State on Aug. 31, 1925, was \$4,412,566, or 87 cents per capita, as against 90 cents in 1924 and \$1.07 in 1917. The assessed valuation of property subject to State tax was \$3,602,217,082. The State tax levy was \$27,737,071, or \$5.47 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 16,198. Switching and terminal companies operated 225 miles of tracks. There was constructed, in 1926, 242 miles of first track, the highest total in the year for any State. Of this total the Southern Pacific built 96 miles south of San Antonio, near the Mexican border; the Missouri Pacific, in the same area, 50 miles;

the Atehison 31 miles, in the Panhandle region; the Rock Island, 37 miles north from Amarillo to form a portion of a new line from Amarillo to Liberal, Kan. There were abandoned 11 miles between Waco and Ross, by the Southern Pacific, and the Nacogdoches and Northeastern abandoned and took up 14 miles between La Cerda and Pershing.

**EDUCATION.** There was created and set to functioning an Education Commission of Texas. It was described in the *Journal of the National Education Association* as "a sort of supreme court to pass judgment on the wisdom and feasibility of propositions relative to education which should be submitted to it," and was maintained by the State teachers' association. The special session of the thirty-ninth legislature appropriated from general revenue \$3,500,000 to supplement the school fund, so as to bring the per capita rate to \$14. An amendment to the State constitution gave to county boards the power, previously exercised by the legislature, to create independent districts. The school population of the State in 1926 was placed at 1,348,646. Enrollment in the public schools in the academic year 1925-1926 was 1,210,127, that in the common schools being 1,015,951 and in the high schools 194,176. Expenditures for public education in the year previous, 1924-1925 (the latest figures available), amounted to \$62,180,335. The average salary for all teachers in the schools in 1925-1926 was \$943.

**CHARITIES AND CORRECTIONS.** The State Board of Control, composed of three appointed members serving non-coinciding 6-year terms, held in 1926 financial and partial executive control over 17 State institutions. These were the Austin state hospital, Texas school for the deaf, Texas school for the blind, Confederate home, Confederate women's home, deaf, dumb and blind institute (colored), and Austin state school, all at Austin; the San Antonio, Terrell, Rusk, Abilene and Wichita Falls State hospitals; State juvenile training school, at Gatesville; the State orphan home, at Corsicana; the Girls' training school, at Gainesville; the State tuberculosis sanatorium, at Carlsbad; the home for dependent and neglected children, at Waco. The State prison system was independent of the Board of Control.

**POLITICAL AND OTHER EVENTS.** In the election, November 2, Dan Moody, Democratic candidate for Governor, was elected, defeating H. H. Haines, the Republican nominee, in a light vote. The entire Democratic State ticket was elected, as were likewise 17 Democratic members of the United States House of Representatives and one Republican.

The height of the Governorship campaign was reached in the primary elections earlier in the year. Attorney-General Moody, the leading opponent of the Ferguson régime, received the leading vote in the Democratic primary of July 24, his vote being given as 411,390 to 281,938 for Governor Miriam A. Ferguson. As four other candidates received a considerable aggregate vote, Moody lacked 1770 votes of the required clear majority. A run-off primary was accordingly held August 28, in which the vote for Moody increased to 458,669, while that for Governor Ferguson declined to the reported total of 240,597. In September there convened a special session of the State legislature, called to validate highway bonds. It had been de-

manded for months by the opponents of the Governor, desiring to investigate her administration. The lower house by a vote of 104 to 22 called, September 16, for an investigation of the Ferguson administration, with more special reference to its conduct in the matters of highway financing, the purchase of school text books and the taxation of oil and sulphur.

Texas legislation imposing assessments for meeting expenses of highway building was declared unconstitutional by a decision of the United States Supreme Court rendered January 4. The State's boundary dispute with Oklahoma over an area north of the Red River was placed before the United States Supreme Court, which ordered a new survey. The Texas Bankers' Association meeting at Dallas adopted, October 27, a plan to create a \$5,000,000 corporation for the purpose of retaining for 18 months a total of 1,250,000 bales of cotton raised in Texas, and then in the hands of growers pressed for cash. The size of the Texas crop rendered necessary a \$5,000,000 corporation, as against \$1,000,000 corporations set up in several other States. The Texas Cotton Finance Corporation was created along these lines, and J. A. Pondrom, president of the City National Bank of Dallas, was made its president, December 7. The State Bar Association, through a committee, recommended for enactment by the legislature an extensive reform of court procedure designed to expedite the disposal of lawsuits.

Governor Ferguson in the closing period of her term issued pardons in great number to persons under prison sentence. According to a news dispatch, December 27, she had issued over 3000 clemency proclamations during her administration. On the disputed question of the validity of highway bonds the State supreme court declared in some respects favorably, by a ruling in December. In this ruling the validity of county bonds of Tom Green County was affirmed, on the ground that these bonds had been validated by the legislature.

**OFFICERS.** Governor, Miriam A. Ferguson; Lieutenant-Governor, Barry Miller; Secretary of State (appointive); Treasurer, W. Gregory Hatcher; Comptroller, S. H. Terrell; Attorney-General, Dan Moody.

**JUDICIARY.** Supreme Court: Chief Justice, C. M. Cuerton; Associate Justices: T. B. Greenwood, William Pierson.

**TEXAS, UNIVERSITY OF.** A State institution of higher education at Austin, Texas, with a medical branch at Galveston and a college of mines at El Paso; founded in 1881. For the autumn of 1926 the enrollment totaled 5162, and for the summer session, 2972. There were 405 members of the faculty, an increase of 41 over 1925. The endowment resources of the institution, including land, land notes, bonds, and cash, amounted to \$11,108,300, and the income from legislative appropriation, fees, and income from endowment was estimated at \$2,584,800. The number of volumes in the library was 355,523. President, Walter Marshall William Splawn, Ph.D.

**TEXTILE INDUSTRY.** The textile industry in 1926, in the general results secured, was on about the same basis as in the previous year, and especially as regards volume of production. During 1926 there was a considerable decline in the value of textile materials, cotton showing a continued fall, which was followed by silk and

wool. Cotton consumption by American mills increased about 4 per cent in 1926 and the number of cotton spindles active about 1 per cent, but there was a decrease of 4 per cent in the consumption of wool, and a decline in the activity of woollen spindles, though worsted spindles were more active. While silk deliveries (see SILK) were on practically the same basis as in the previous year, the number of spindles active had declined nearly 10 per cent. With increased activity in cotton manufacturing there was a decline in the margin of profits, though wool manufacturing showed improved conditions, especially in the late summer. The textile industry in New England continued to be the subject of considerable discussion, in view of the removal of manufacturers to the South and their preference for building new mills in that region. The securities of New England mills continued to decline, while those of Southern cotton mills maintained a fairly firm position. In wool manufacturing the earnings were greater than in the previous year, and the stocks recovered somewhat from the decline.

The total value of textiles exported from the United States in 1926 was \$1,010,277,054, or considerably less than in 1925, when a total of \$1,278,370,472 was reached. Of this total, manufactures of cotton amounted to \$112,005,367 in 1926, as against \$126,027,065 in 1925. The total value of the exports of wool manufactures in 1926 was \$3,954,187, as against \$4,931,858 in 1925, and of the manufactures of silk \$17,788,377 in 1926 as against \$18,181,846 in 1925. Exports of manufactures of artificial silk (rayon) amounted to \$7,880,704 in 1926, as against \$8,700,543 in 1925. Exports of miscellaneous textile products had a total of \$20,078,286 in 1926, as against \$20,433,265 in 1925.

The imports of cotton manufactures during 1926 in the main were less than in 1925. Thus the total value of cotton manufactures imported was \$60,697,159, as compared with \$70,227,818 in the previous year. Manufactures of wool imported in 1926 amounted to \$59,194,465, as compared with \$55,483,557. Manufactures of silk imported had a total value of \$40,569,818 in 1926, as against \$36,719,080 in 1925. Artificial silk and manufactures imported in 1926 were valued at \$13,898,990, as against \$13,118,307 in 1925.

**NEW MILL CONSTRUCTION.** During 1926, 178 new textile mills were built, according to the annual record of the *Textile World* (New York). This was the lowest number since 1897, and was even below the previous low mark of 186 new mills in 1924. During the year, the whole or part of the equipment of various Northern plants was transferred to the South, in continuance of a policy that had been followed for a year or two previously, and there were in process of construction or in course of planning a number of large projects in Alabama, Arkansas, Georgia, Kentucky, Louisiana, North Carolina, South Carolina, Tennessee, Texas, and Virginia. An important tendency of the year was the merging of large companies in the cotton, knit goods, and silk industries, so that one enlarged mill would contain the consolidated equipment and lower manufacturing costs would ensue. In California, a silk weaving mill which had been operated for some years added new looms, dyeing and finishing equipment, and was also developing in the spinning and hosiery knitting fields so as to

cure the advantage of favorable location to the supplies of raw silk landed on the Pacific Coast. As distinct from expansion in the actual spindleage and loomage in the United States, which was conspicuous by its absence, there was a general policy of improving equipment and reorganizing plants, so as to secure increased economies along with diversification of product, which policy, it was believed, would be advantageous in the immediate future.

In the South, 21 new cotton mills were added during the year, 7 of which were in North Carolina, 5 in Georgia, 2 in Alabama, and 2 in South Carolina, while 1 mill was added in each of the following: Arkansas, Kentucky, Louisiana, Tennessee, and Virginia. In North Carolina there were additions to plant or equipment of 38 existing mills, and after that State came South Carolina with 23, Georgia with 16, Alabama with 14, and Texas with 9 projects for increase or expansion. Dealing with special installations, the 50,000-spindle addition to the mill of the Cannon Manufacturing Co. at Kannapolis, N. C., and the construction of a new power plant at that place, was a notable event, while at Thomaston, Ga., there was built the Martha Mills for making tire fabric, with 30,000 spindles. A new unit at the China Grove, N. C., Cotton Mills Co. plant was built to house 30,000 spindles. Equipment from Passaic, N. J., Philadelphia, Pa., and Lowell, Mass., was transferred to various Southern plants, the Appleton Manufacturing Co., for example, continuing the moving of 30,000 spindles from Lowell, Mass., to Anderson, S. C.

In the North, 10 new mills were established, including two plush mills, a webbing and braiding plant, a damask drapery mill, a thread mill, a winding plant, a towel mill, a twine mill, and a tape mill, and 18 cotton mills in Pennsylvania enlarged their plants and 10 in Rhode Island increased their facilities.

During the year 9 new woollen mills were established in California, Maine, Massachusetts, New Jersey, New York, Pennsylvania, and Rhode Island, of which the most important was the Ohio Carpet Co.'s plant at West Warren, Mass.

Fifty-two new knitting mills were built during the year, a decline of 32 from the total of 84 in 1925. Possibly the most interesting was a new silk hosiery mill at Hermosa Beach, Cal. In Pennsylvania 23 new mills were built.

In the silk industry 37 new mills were started, of which the plant of the Old Colony Silk Mill Corporation, with 12,000 spindles and 144 looms, in New Bedford, Mass., was notable.

For manufacturing rayon (q.v.) there were a large number of new projects put under way by the established companies working in this field, including those of the American Cellulose and Chemical Manufacturing Co. at Amcelle, Md.; the Belamose Corporation at Rocky Hill, Conn.; the Du Pont Rayon Co. at Buffalo, N. Y., and Old Hickory, Tenn.; the Viscose Co. at Lewiston, Pa.; Roanoke, Va., and Parkersburg, W. Va. At Bemberg, near Johnson City, Tenn., the American Bemberg Corporation completed its plant, and at Clifton, N. J., Cupra, Inc., started the first unit of its plant. At New Castle, Del., the Delaware Rayon Co. was formed, and acquired a plant in which machinery was being installed.

The miscellaneous new mills of the year totaled 38, divided as follows: Twenty-four dyeing, bleaching, and finishing plants; 3 braid

linen mill, an asbestos yarn and cloth mill; a wadding plant; an insulating yarn mill; a jute yarn mill; a hooked rug plant; and a converting and backwinding plant.

The new mill construction in the United States in the ten years 1917-1926 is given in the table above.

**THEATRE.** The year in the theatre in the United States was uneven in its manifestations. General prosperity was reflected in the continuance of demands for entertaining performance on the part of the public and an almost incredible number of bids for popular favor by optimistic producers. During the year about 260 plays were staged in the Broadway theatres of New York alone. The number of financial successes is, to a degree, calculable. In the so-called legitimate field, about 20 per cent of the offerings made money for their producers. In the musical comedy world, where initial expenses are larger, the percentage of successes was larger, but here it was no more than 50 per cent. Some idea of the practical problems that face the promoter of new types of plays and new ideas in the theatre may be gained from these figures. They account for the conservative attitude of the managers and indicate, too, the possible service of the "little theatres." The number of thoroughly satisfactory plays, judged by standards other than those of the box-office, is arguable, but a symposium of opinions would not put the figure much higher. And certainly the two lists would not contain exactly the same names. But there were a half dozen plays of merit sufficiently vigorous to demand attention at any time, and there are a dozen others that deserve some notice as they pass to the storeroom and library. Comparison of the products of the American year with those of the foreign stage in the same period does not indicate anything of greater importance in Europe.

The first of January, 1926, found a half dozen successes moving calmly along the paths of mid-season prosperity. *Abie's Irish Rose* must head that list. Others that had, and were continuing, a success were *Is Zat So*, *Cradle Snatchers*, *The Green Hat*, *Craig's Wife*, *Young Woodley*, and *The Last of Mrs. Cheyney*. Most of these were mentioned in brief review in the article **THEATRE** in the 1925 **YEAR BOOK**. *The Last of Mrs. Cheyney*, another Frederick Lonsdale comedy of bright lines and smart manner, had a cast that included Ina Claire, Roland Young and A. E. Matthews. It gave the familiar Lonsdale picture of English society and is to be noted, as suggested, not for its rather absurd although amusing story, but for its delightful banter and civilized conversation. The advent of naturalism and dialect in the American theatre has emphasized the painful paucity of decent English or even inoffensive American on the stage. It is not the business of the theatre to teach good language, or anything else, but when the opportunity exists for the making of a great national impression it seems unfortunate to have to reflect that the Great American Playwright, when

and if he comes, may write the language of New York's Ninth Avenue.

The splendid exception—or at least one of the splendid exceptions—to the general tenor of the time here was Walter Hampden. His season was interesting and, on the whole, probably successful. The early part of the year saw him continuing in Shakespearian revival. After *Hamlet* came *The Merchant of Venice*, with Ethel Barrymore as *Portia*. This was followed by a successful (as always) revival of *Cyrano de Bergerac*, this time with Edith Barrett as *Roxane*. Still later, in the spring, he played his old rôle in a revival of *The Servant in the House*. In the fall Mr. Hampden tried, without much success, a play by Tom Barry called *The Immortal Thief*. And this was followed by his most distinguished new contribution of the year. The stage version of Browning's *The Ring and the Book* was contemplated with some pessimism by most followers of the theatre but their doubts were groundless; *Caponsacchi* proved to be actable, colorful and moving. Living verse, pageantry, finished character acting, carried the play far above the commonplaces of the season, despite the dramatic clumsiness of the material. Cecil Yapp and Stanley Howlett, as well as Mr. Hampden, gave exceptional performances.

The Theatre Guild, now among the most forceful organizations in the New York theatre, had an uneven year. Probably the first part of the year was not especially successful so far as money goes, but we are all well educated to the belief that the Theatre Guild has no care for the usual goal of the manager and producer. And several of its performances were beautiful and interesting contributions.

In January *Goat Song*, by the German, Franz Werfel, opened at the Guild Theatre. The title is, of course, the literal rendering of the Greek words which we have called "tragedy." It was a beautifully massed and moving large-scale entertainment in color and motion alone. It was well that it was so, for its symbolism, not too abstruse in the book, was like most symbolism, terribly vague in the theatre. Alfred Lunt, Lynn Fontanne and Albert Bruning were among the better known members of the cast. The play was too expensive for production, except to capacity houses, and lasted but the usual subscription period. The first Theatre Guild financial success—and not a great one at that—came in April. This was the C. K. Monro comedy, *At Mrs. Beam's*. Mrs. Beam was the keeper of a boarding house, and the major business of the play was the delineation of character, perhaps in George Kelly fashion, but with more generally humorous results than Mr. Kelly usually achieves.

At about the same time as the production of *At Mrs. Beam's*, the formation of the Theatre Guild acting company was formally announced. The idea of a permanent or semi-permanent acting company was, of course, not new. Its desirability had been as obvious to actors as it had

been to the Guild people themselves, for years. But it had always meant a heavy financial burden to be carried the year round, and managers have, of late, been very much aware of that fact. It means the gathering together of a group of competent actors and actresses sufficiently capable to fulfill the demands of the repertory theatre. Such Thespians must of necessity be the best, or nearly the best, in their profession. The best is always expensive. The Guild's undertaking was a large one, and should have the happiest results. The members of the company as at first announced included, Alfred Lunt, Lynn Fontanne, Dudley Digges, Henry Travers, Clare Eames and Helen Westley. Guest players of importance are to be found in most of the later productions of the Guild, however.

Early February saw *The Shanghai Gesture* by John Colton, known best in the theatre as co-author of the dramatic version of the Somerset Maugham story known on the stage as *Rain*. *The Shanghai Gesture*, with Florence Reed as Mother Goddam, had a considerable commercial success. It was good melodramatic "hokum" of the shocker variety. A noteworthy performance was given by a young actress, Mary Duncan. Miss Reed gave the most exactly artificial performance of the season. That was certainly something. Following *The Shanghai Gesture* by a week or so was *Lulu Belle* by Charles MacArthur. This was a Belasco production destined for great success with Lenore Ulric in the title rôle. It was concerned, perhaps rather more intimately than necessary, with the private and public life of a negro damsel of light complexion and character. It gave with great faithfulness details of New York negro life in Harlem. And it gave a splendid opportunity for Lenore Ulric to prove, once again, that she is an actress of immense vitality and skill. Henry Hull supported her, in the play, literally, and, in the critic's sense, with real distinction. Mr. Belasco's scenes were in his usual photographic manner, thorough in every detail.

A revival that was not without its interest was that of the Louis K. Anspacher play of some years ago, *The Unchastened Woman*. As so many revivals prove, times have changed since the day in which *The Unchastened Woman* was called an important contribution to social and dramatic literature. Violet Kemble Cooper was the lady of the title, but nothing could alter the obvious fact that the play was dated and had only that historic interest which may attach to that vague era before the War. The play had no popular success in revival.

*The Bride of the Lamb*, with Alice Brady as its star, came to the Greenwich Village Theatre late in March. This was a play by William Hurlburt, known as the author of several plays of marked strength that have had no popular success. Its theme, the effects of the terrific emotional excitement that marked the advent of an old-fashioned evangelist, gave Alice Brady an opportunity for a display of dramatic pyrotechnics that was extremely effective. The title derives from the confusion, in the weak, emotionally starved woman, of the doctrine and the body of the intensely magnetic evangelist. In giving herself to him she seems to be giving herself to Christ. Her lack of mental balance intensifies—the curtain goes down as she babbles pitifully the stirring phrases that have become part of her in the excitements produced in the meetings. The

performance was in many ways noteworthy. The play, commercially, had only fair success. The eternal and unanswerable argument of the theatre-going public—that it wants to be entertained without being distressed—was manifested in its usual form. The public did not attend.

The "little theatre" of the country had its week early in May. The annual tournament for the David Belasco trophy was held at the Bayes Theatre. It was conducted by Walter Hartwig in coöperation with The Manhattan Little Theatre Club, Incorporated. Groups of players from all over the United States gave one-act plays; the prize-winners came from Dallas, Texas. Their play was *El Cristo*, by Margaret Larkin. As a demonstration of the countrywide influence of the stage, and of the importance of the "little theatre" as the possible home of the newer forms of the drama, the exhibition was interesting. As a matter of fact, there was little proof of vital influence on the commercial stage, which must still remain the real centre of the theatrical world—until such time as we develop more than just very good amateur acting. Amateur acting is and always must be just that. Still, we have seen in the Theatre Guild what the expansion of a small group may ultimately bring about.

A gloomy and impressive play by Daniel N. Rubin, that bore the inauspicious title of *Devils*, was the last really interesting production of the season that was soon to pass into its usual summer slack-tide. *Devils* gave a forbidding picture of mistaken religion and backwardness among the Kentucky mountaineers. It bore traces of generic likeness to Hatcher Hughes' play of two or three years ago, *Hell Bent For Heaven*. But again the diet was too heavy for Broadway, and the play was a commercial failure. John Cromwell gave a strong performance as the Rev. Matthew Dibble.

The summer passed without giving rise to any obtrusions in the theatre that were more serious than the usual summer comedy. The Garrick Gaieties of the Junior Guild was diverting and gave opportunity for several members of its company to display themselves to such good advantage as to be found later in the year among the principals in various quite grownup musical comedies.

One of the first openings of the fall season was *The Donovan Affair* by Owen Davis, one of the real craftsmen of the American theatre. A succession of plays has streamed from his direction since the days of *Nellie, the Beautiful Cloak Model*. *The Donovan Affair* had a commercial success and was entitled to a place well up on the roll of the melodramas of its variety of the past few years. But there were many more interesting openings destined for the cooling nights of the fall season. Among them were to be *Broadway, Gentlemen Prefer Blondes, The Captive, Deep River, Suarez and Maximilian, An American Tragedy, White Wings*, and *Daisy Mayme*, as well as the Guild productions of two Sidney Howard plays.

*Broadway*, the most decided hit of the year, was the work of George Abbott and Phillip Dunning. It is a swift moving, vivid melodrama of Broadway life circulating in and around the night clubs. The reasons for its success were not difficult to discover; all the ingredients that seem so simple in analysis are there. The syn-

SCENE FROM ACT I LEFT TO RIGHT CHRYSTAL HERNE CHARLES TROWBRIDGE, AND ANNE SUTHERLAND

thesizing of those same materials into another popular success will surely occupy a large part of the time of a good many of the commercial playwrights for the next year or two. Witness the crop of poor relations of *Abie's Irish Rose* that have come and gone.

*Gentlemen Prefer Blondes* came to town from a Chicago success late in September. It is, of course a dramatization, of a kind, of the material in Anita Loos' book of the same name. It is not a play at all in one conception of the drama; but as entertainment it may be placed well up on the list. In spite of the enormous publicity it received, the stage version achieved no more than moderate success. June Walker, in the title rôle, donned a blonde wig and proceeded to be the very incarnation of gentlemen's desire. Her performance was a splendid demonstration of her versatility, as one considers the parts she has played in the previous years.

*The Captive*, an adaptation of *La Prisonnière*, the French play by Edouard Bourdet, was one of the most discussed plays of the season. It received the dubious compliment of inspection by the New York play jury, a group of self-sacrificing men and women occasionally called on by the mayor or the district attorney to inspect possible threatenings of the community morality. Its theme, Lesbianism, was well handled from the dramatic point of view; probably there was no better written play on the American or European stage during the year. The rendering was excellent. Helen Menken, Basil Rathbone and an equally competent supporting company gave a very satisfactory performance. But the question that remained in many people's minds was the serious one as to whether there is not, after all, a possible limit to the exploitation of unhealthy human abnormalities for box-office purposes. There was probably no need for alarm; the public seemed to be well able to take care of itself, and would do so by the very simple and effective process of not going to see plays that were not good entertainment, despite the fact that they may be as lurid in their appeals as the tabloid newspapers. *The Captive* owed its commercial success primarily to the fact that it was good entertainment; only secondarily to the moral concern it aroused.

*Deep River*, a native opera, so-called, of American negro musical impulses and rhythms, was brought to town by Arthur Hopkins, but had only feeble success. It was lacking in popular appeal in spite of the apparently novel and interesting material it had to offer as its reason for being.

The Theatre Guild in mid-October staged a really noteworthy production, *Juarez and Maximilian*, by Franz Werfel. This production was worthy in every way of the best traditions of Guild performance. Popularly, it could not be reasonably expected to be very successful, and it was not. The treatment of the character of Maximilian, played magnificently by Alfred Lunt, was expository rather than dramatic. The Werfel conception of Maximilian as an essentially sensitive, impractical, gently visionary soul, was not adapted to that conflict that is the essence of theatrical effectiveness. But the production brought out the very satisfactory best of which the Guild is capable in directing and action. Clare Eames, Margalo Gilmore, Dudley Digges and Henry Travers were also in the cast.

Patrick Kearney's dramatization of Theodore Dreiser's *An American Tragedy* proved to be, as might have been expected, heavy material for the theatre. Morgan Farley played the lead, and the play had a fair success, mainly attributable to the wide publicity the book had received.

George Kelly's *Daisy Mayme*, an honest and artistic effort in his usual drab realism of manner, was not as much of a success as his two previous plays. It was a depressing repetition of Mr. Kelly's feeling that life in West Philadelphia may be a terrible thing. The characters are, without exception, grasping, small-souled, sordid. The resultant of their petty conflicts is unimportant except as social portraiture; which may, of course, make it very important. In his meticulous scrapings Mr. Kelly has been successful in imparting an overwhelming sense of the futility of so much of human life. At the moment the public has had, perhaps, all it desires of the manner in question.

Molnar's *The Play's the Thing*, came along in November and showed New York how cleverly an experienced dramatist could handle the materials of the theatre; in its easy sophistication it furnished justification for a real success. Holbrook Blinn was starred.

The three most noteworthy plays of the late year as it drew to a close with the usual holiday depression were all Guild productions. Two of them were by Sidney Howard; the other was a revival of Shaw's *Pygmalion*. The Shaw play may be allowed to pass with the remark that it was none too impressive to-day as Shaw, which does not mean that it was not amusing and well received. Poor Shaw may compare favorably with good current material, as has been demonstrated before.

*Ned McCobb's Daughter*, the first and the best received of the Sidney Howard plays, is a grim study of contrasting types in a northern New England setting. The second of his plays, produced by the Guild in alternation with their other plays of the late fall, was *The Silver Cord*, a development of the not unusual conception of the possible influence of a jealous mother's instinct in the relations of her grown-up sons with other women.

During the year a number of interesting foreign visits to the United States gave the native actors some idea of what constitutes distinction in the European theatres. Several well known foreign theatre groups played in New York, and in one or two cases went on tour. Among these were the Moscow Art Theatre, Raquel Meller, the Spanish disease, the Princess Theatre company of Madrid, Sacha Guitry and his wife, Yvonne Printemps, Cecile Sorel, Jacques Copeau and many others of lesser fame.

Raquel Meller, much heralded, arrived to play under the management of E. Ray Goetz. Her art, which seems to Americans to be best adapted to the short entertainment of the vaudeville theatre, was made to occupy some two hours, becoming of necessity monotonous. No one was disposed to deny Señorita Meller praise for the exquisite in her work; the usual qualification was that here suggested.

Before passing to a final résumé of tendencies in the theatre of the year it should be remarked that there was but one Eugene O'Neill play of the year. *The Great God Brown*, obscure as it was to some, nevertheless gave the impression, on further acquaintance, of being a sensitive and

poetic attempt at the impossible in the theatre of to-day, that turned out to be quite remarkably successful from the commercial point of view, its character considered. There were revivals of *The Emperor Jones* with Charles Gilpin, and an Actor's Theatre revival of *Beyond the Horizon*.

The Pulitzer Prize for the year was awarded to the George Kelly play mentioned in the 1925 YEAR BOOK, *Craig's Wife*.

As one glances over the list for the year, one can but be impressed by the technical equipment manifested by American dramatists of the moment. George Kelly, Eugene O'Neill, Sidney Howard, George Abbott, are names that are almost new to the world—young men of the theatre still, despite O'Neill's world-wide reputation—and there are a dozen others of potential power. It is quite possible that the finest productions of the theatre in America are finally to be reckoned as some of the plays already with us and soon to come. See *Drama*, under LITERATURE, ENGLISH AND AMERICAN.

The manner of theatrical expression has changed very little, after all. The brief spasm of expressionism that brought forth *Processional* a year or two ago seems to have passed. Imitations of the mood of *Processional* have been failures in almost every instance. *The Wisdom Tooth*, by Marc Connelly, of the past year, was merely fantasy in the familiar Barrie manner. *The Great God Brown* struck the most original note of the year but one that obviously will not bear frequent repetition. It will appear, then, that the year was not unusual and not unsatisfactory from the standpoints of both students of the drama and the casual theatregoing public. The establishment of the Theatre Guild in repertory and the undertaking of the establishment of a Civic Repertory theatre by Eva Le Gallienne, down in the old Fourteenth Street Theatre, may be suggested as in their way evidences, of the most important variety, of the prosperity and vitality of the theatre. Miss Le Gallienne's venture, which was fairly successful, aroused admiration for her courage; and a list of the plays she produced gives some idea of the scope of the so-called Civic Repertory Theatre. The plays which appeared in Fourteenth Street were *The Master Builder*, *John Gabriel Borkman*, *Saturday Night*, *La Locandiera*, *Twelfth Night*, *The Three Sisters*; several others were scheduled for production in the new year.

Among the musical shows of the year, Gilbert and Sullivan's *Iolanthe*, staged by Winthrop Ames, must be named as remarkably successful and satisfactory in revival. *The Pirates of Penzance* was produced later in the year with success, but without the distinction that marked *Iolanthe*. Among modern performance *The Song of the Flame*, *The Vagabond King*, *George White's Scandals*, *Americana*, *Oh Kay* and *Peggy Ann* must be numbered. The turn of the year arrived with a number of new musical productions in the offing, but after all there was nothing to rival the unusual success of *Rose Marie* and *Sunny* of last year.

The following were produced in the New York theatres during the year in approximately the order in which they are listed:

NEW PRODUCTIONS AND REVIVALS. From January 1 to June 1: *Dope*, *The Scarlet Letter*, *The House of Usher*, *Move On*, *Money Business*,

*The Dream Play*, *Tangled Lives*, *The Great God Brown*, *Goat Song*, *The Love City*, *Shelter*, *Nico*, *Hedda Gabler*, *A Weak Woman*, *Magda*, *Not Herbert*, *Puppy Love*, *Don Q., Jr.*, *John Gabriel Borkman*, *The Shanghai Gesture*, *Embers*, *The Matinee Girl*, *Little Eyolf*, *The Great Gatsby*, *The Jest*, *Love 'Em and Leave 'Em*, *The Beaten Track*, *The Jay Walker*, *Lulu Belle*, *Port o' London*, *The Wisdom Tooth*, *The Right Age to Marry*, *The Night Duel*, *The Right to Kill*, *You Can't Win*, *The Unchastened Woman*, *The Emperor Jones*, *Cyrano de Bergerac*, *The Virgin*, *Mamma Loves Papa*, *The Creaking Chair*, *Still Waters*, *Square Crooks*, *The Masque of Venice*, *Nirvana*, *The Trouper*, *Find Daddy*, *East Lynne*, *The Moon Is a Gong*, *Juno and the Paycock*, *Hush Money*, *Ninety Horse Power*, *Ghosts*, *Devils*, *Schweiger*, *Easter*, *One Day More*, *The Chief Thing*, *What's The Big Idea*, *The Half-Caste*, *The Bride of the Lamb*, *Kongo*, *Aucassin and Nicolette*, *The Two Orphans*, *Beau Gallant*, *A Stranger In the House*, *Glory Hallelujah*, *Love-in-a-Mist*, *The Bella*, *White Cargo*, *What Every Woman Knows*, *Aloma of the South Seas*, *Three Doors*, *The Poor Nut*, *The Gorilla*, *Rosmersholm*, *Pomeroy's Past*, *At Mrs. Beam's*, *Beau-Strings*, *A Friend Indeed*, *Sea*, *The Importance of Being Earnest*, *The Servant In the House*, *The Sport of Kings*, *The Romantic Young Lady*, *The Climax*, *The Guerro Mendoza Company* in repertoire, *One Man's Woman*.

From June 1 to December 30: *Henry IV*, *The Half-Naked Truth*, *Beyond Evil*, *The Blonde Sinner*, *Honest Liars*, *Pyramids*, *No More Women*, *My Country*, *Loose Ankles*, *The Little Spit-Fire*, *Sunshine*, *The Home Towners*, *Henry—Behave*, *The Ghost Train*, *Service For Two*, *The Donovan Affair*, *The Adorable Liar*, *Potash and Perlmutter*, *Detectives*, *She Couldn't Say No*, *If I Was Rich*, *Scotch Mist*, *Fanny*, *Yellow*, *Sandalwood*, *The Shelf*, *The Judge's Husband*, *Gentlemen Prefer Blondes*, *The Woman Disputed*, *The Captive*, *The Immortal Thief*, *Happy-Go-Lucky*, *Sour Grapes*, *What's The Use*, *No Trespassing*, *Number 7*, *Two Girls Wanted*, *Henry's Harem*, *Just Life*, *Broadway*, *Treat 'Em Rough*, *The Good Fellow*, *Black Boy*, *The Jeweled Tree*, *Secret Sands*, *The Lion-Tamer*, *Buy Buy Baby*, *The Humble*, *The Straw Hat*, *Juarez and Maximilian*, *An American Tragedy*, *Rain*, *We Americans*, *They All Want Something*, *White-Wings*, *On Approval*, *God Loves Us*, *John Ferguson*, *Sure Fire*, *The Noose*, *The Ladder*, *Daisy Mayme*, *Saturday Night*, *Autumn Fire*, *The Three Sisters*, *Caponsacchi*, *The Genile Grafters*, *Loose Ends*, *The Seed of the Brute*, *The Master Builder*, *The Play's the Thing*, *The Little Clay Cart*, *Mozart*, *Ned McCobb's Daughter*, *Up the Line*, *La Locandiera*, *This Was A Man*, *Beyond the Horizon*, *Say It With Flowers*, *Pygmalion*, *Lily Sue*, *The Constant Wife*, *Princess Turandot*, *First Love*, *Naked*, *Head or Tail*, *Old Bill*, *M. P.*; *The Squall*, *A Proud Woman*, *Gertie*, *Slaves All*, *The Strange Prince*, *This Woman Business*, *The Constant Nymph*, *Howdy King*, *Hangman's House*, *The Dybbuk*, *The Wooden Kemono*, *What Never Dies*, *The Devil in the Cheese*, *Chicago*, *In Abraham's Bosom*, *New York Exchange*.

MUSICAL AND REVUES: *Carmencita* and *the Soldier*, *Love and Death*, *Sweetheart Time*, *The Bunk of 1926*, *Kitty's Kisses*, *Garrick Gaieties*, *The Great Temptations*, *Lucky Sambo*, *The Merry World*, *George White's Scandals*, *Grand*

*Street Follies of 1926, Ziegfeld Palm Beach Girl, My Magnolia, Americana, A Night In Paris, Nio Nao in 1926, Earl Carroll Vanities, Queen High, The Ramblers, Honeymoon Lane, Costles in the Air, Naughty Biquette, Countess Maritza, Deep River, Criss Cross, Katja, The Wild Rose, The Pearl of Great Price, The Desert Song, Twinkle Twinkle, Oh Kay, Gay Paree, The Pirates of Penzance, Oh Please, Peggy-Ann, Betsey.*

See **Drama** under **FRENCH LITERATURE**, and **GERMAN LITERATURE**.

**THEODORINI**, HELENA. Rumanian dramatic soprano, died in Bucharest, in March. She was born at Craiova, Mar. 25, 1862. At the age of 9 she appeared in public as a pianistic prodigy, and, after further study of the piano and of singing at Milan, made her operatic debut at Cuneo, in 1879, as a contralto. Gradually her voice changed, and she appeared as a soprano in Warsaw, Milan, Madrid, Lisbon, London, and Buenos Aires. In the last-named city, where she celebrated her greatest triumphs, she remained a number of years. In 1903 she was married to Baron d'Harmezak and retired from the stage, settling in Paris as a teacher. From 1916-18 she resided in New York.

**THEOSOPHICAL SOCIETY**. An organization claiming to be the direct outgrowth of the Theosophical movement which was organized in New York in 1875. During the year 1926 the international president, Dr. Annie Besant, returned to the United States bringing with her a young Hindu, J. Krishnamurti, whom she claimed to be the chosen vehicle through which the "Messiah" or World Teacher would speak when He should come again. The Society had, in 1926, over 10,000 members, of whom 8582 were active. Its periodicals were *The Messenger*, the American official organ, and *The Theosophist*, issued at the headquarters in India. The headquarters of the American Theosophical Society were at 826 Oakdale Avenue, Chicago; L. W. Rogers was president, and Mrs. Maude N. Couch, secretary-treasurer.

**THEOSOPHY**. The Theosophical movement was founded in New York City in 1875, by Mme. Helena Blavatsky. Its aim is the spiritual quickening, the moral elevation, and the intellectual enlightenment of the race on the questions of man's origin, nature, and destiny, and his relation to the universe about him. It is aided by a number of working organizations. It is not a belief or dogma, but its members may hold any religious belief or none, its purpose being merely the searching for truth, wherever and in whatever form it is to be found. During the year 1926 a number of unrelated movements were active in the name of Theosophy, particularly the "Messiah" movement. See **THEOSOPHICAL SOCIETY**. Publications of the year include a French translation of Madame Blavatsky's *Au Pays des Montagnes Bleues*, the translation from English into French of the *Ocean of Theosophy*, and new editions of *The Mahatma Letters to A. P. Sinnett*, and *The Theosophical Movement, 1875-1925, A History and a Survey*.

**THERMOMETER**. See **CHEMISTRY, INDUSTRIAL**.

**TETFORD**, BISHOP OF. See **BOWERS**, RT. REV. JOHN PHILLIPS ALLCOT.

**THURIN'GIA**. A federated state of the Ger-

man republic, created at the end of 1919; comprising the following states of the former German Empire—Eisenach, Gotha, Reuss, Saxe-Altenburg, Saxe-Meiningen, Saxe-Weimar, Schwartzburg-Rudolstadt, and Schwartzburg-Sondershausen. Area, 4541 square miles; population, according to the census of 1925, 1,628,398. Capital, Weimar, with a population in 1919 of 41,403. Other large towns with their populations at that date were Gera, 74,993; Jena, 53,906; Gotha, 48,543; Eisenach, 41,375. The arable land is estimated at 44 per cent of the total area. The acreage and production of the principal crops in 1924 were: Wheat, 140,827 acres, 101,412 tons; rye, 169,088 acres, 104,569 tons; oats, 140,827 acres, 132,830 tons; potatoes 159,253 acres, 484,719 tons. The government is under a diet, which acts through a state council. In the elections held in February, 1924, the following parties were returned: Conservative bloc, 35; Socialists, 17; Communists, 13; German Race Party, 7. The executive authority is intrusted to the president of the state council. The president of this council in 1926 was Dr. Leutheusser.

**THYSSEN**, AUGUST. German steel magnate and industrialist, died at Lindsberg Castle, near Muehlheim, Germany, April 4. He was born of poor parents at Eschweiler, in the Rhineland, May 28, 1842. In his early twenties he founded a rolling mill at Duisburg, and as occasion offered he developed his business and in 1871 he founded the firm of Thyssen & Co., at Muehlheim. This marked the beginning of Germany's industrial era. With his competitors, Krupp and Stinnes, Thyssen expanded steadily, until he earned the sobriquet of "King," controlling more than 70,000 employees. He was also known as the father of the "vertical trust" idea, and in addition to the grip he held on most of the prime industries of Germany he became absolute master of the country's iron and coal. At the beginning of the World War, to which Thyssen was strongly opposed, his blast furnaces and steel mills produced annually 1,000,000 tons of iron and steel, and he was also owner of railroads, docks, and steamship lines. The ramifications of his industries were world wide, his holdings extending through India, France, Belgium, Holland, and South America, to name only the important branches. During the War he manufactured small arms for the Central Powers and competed for large arms so successfully that he broke the Krupp monopoly. In 1911 he had discussed with Judge Elbert H. Gary, at a conference in Brussels, his dream of a world steel trust. He was opposed to a hereditary monarchy and never concealed his aversion to the Kaiser, refusing a decoration at Wilhelm's hands for the services he rendered his country during the World War. He was decorated by the Pope, receiving then the only decoration he would ever accept.

**TIBET**, TI-bét' or tib'et. A region extending eastwards from the Pamirs to the border of China; between the Himalaya and Kwenlun Mountains; nominally under the suzerainty of China. Area, estimated at 463,200 square miles; population, variously given, at 1,500,000 to 6,000,000, the probable figure being about 2,000,000. Capital, Lhasa, with a population of 15,000 to 20,000. Lamaism is the prevailing religion. The chief pursuits are pastoral, and the animals raised include sheep, yak, buffaloes,

pigs, and camels. Some agriculture is carried on, the products including barley, pulse and other cereals, and vegetables. There are considerable industries of wool spinning, weaving and knitting. Of the minerals, gold, borax, and salt are mined to some extent. Trade is chiefly with India and China.

**TIMBER.** See FORESTRY.

**TIN.** In 1926, with decreased supplies and deliveries of tin, the market for this metal continued to range on higher levels than for several years previously. In New York in 1926 the price ranged from 58½ to 72½ cents per pound, as compared with 50½ to 64½ cents per pound in 1925. During the year there were decreased supplies as compared with the previous year, the *Engineering and Mining Journal*, in the table given herewith, estimating the totals at 117,503 tons, as compared with 119,664 tons in 1925. There were increased shipments from Banka and Bolivia and smaller shipments from the Straits Settlements and China. The deliveries of tin increased 2 per cent in the United States, but decreased 20 per cent in the rest of the world in 1926. The deliveries in 1926 totalled 119,201 long tons, as compared with 120,728 tons in 1925.

**TIBOL.** See TYROL.

**TOBACCO.** The tobacco crop of 1926 was an average one. Production of cigar types was below the average, while that of cigarette types was above the average, but not in excess of the trend of consumptive needs. Pipe, chewing, and export tobaccos were slightly below average, but most types were somewhat above consumptive needs. The total tobacco crop was estimated at 1,323,388,000 pounds, produced on 1,664,700 acres. The crop was more than 50,000,000 pounds less than in 1925, but somewhat larger than in 1924. In both previous years the acreage was larger than in 1926. North Carolina led Kentucky in 1926 as the premier State, with a crop of 393,190,000 pounds, worth at current prices about \$103,802,160. Kentucky's crop was 374,880,000 pounds, with a considerably smaller value per pound. More tobacco was exported from the United States and at higher prices than in 1924-25. Bright flue-cured tobacco, the principal cigarette type, constituted over 60 per cent of the total exports of leaf tobacco. Of this, 35 per cent was taken by the

United Kingdom, which continued to be the leading market for American leaf tobacco, and 18 per cent went to China. The increased amount for China was the leading export feature. This market had steadily increased since the War, displacing France as the second largest consumer of American leaf. Coincident with the rapid expansion of foreign trade in cigarette leaf, there had been a decline in demand for cigar types.

Receipts from tobacco taxes of various kinds in the United States during the fiscal year 1926 were the greatest in the history of the internal revenue service, and exceeded the total internal revenue collections from all sources for any year prior to 1914. The total collections from this source were \$370,666,438.87, an increase of \$25,419,227.91, or 7.36 per cent, over 1925. The amount represented 13.07 per cent of the total internal revenue receipts from all sources. Of the total tobacco tax, 68.75 per cent was derived from small cigarettes, amounting to \$254,824,808.19, an increase of 13.24 per cent over 1925. North Carolina far exceeded all other States in tax paid on tobacco manufactures. The revenue act of 1926 repealed the tobacco special taxes and reduced the rates of taxes on large and small cigars. For further statistics on the tobacco industry see the annual report of the Commissioner of Internal Revenue, Washington, 1926.

**TOBAGO.** A West Indian island, included administratively in Trinidad (q.v.).

**TOGO,** tō'gō, or TOGOLAND. A former German protectorate; after the War, divided between Great Britain and France; situated between Dahomey and the Gold Coast. Total area, 33,700 square miles; total population estimated at 762,208, of whom 245 were Europeans. Hamitic tribes make up the population of the north, while in the south the chief stock is the Ewe. To France has been allotted about two-thirds of the total area; namely, 21,200 square miles, including all the coast. The British part bordering the Gold Coast has an area of 12,600 square miles, with a population, according to the census of 1921, of 188,265. The soil is generally fertile and the forests are extensive; the mineral resources are rich but undeveloped. Iron is reported to be especially abundant. Statistics for exports, imports, revenue, and expenditure are no longer available, because they are included in the general totals of the Gold Coast. The governor of the Gold Coast is the administrator of the territory.

In French Togo, the natives engage in agriculture and some manufacturing. The chief agricultural products are corn, yams, plantains, peanuts, etc. The forest products are of some value, but the chief trade is in palm oil, palm kernels, cacao, copra, cotton, and rubber. The native industries include weaving, straw-plaiting, wood-cutting, pottery, etc. In certain districts the natives engage in iron smelting. In 1924 the imports were valued at 54,925,943 francs; exports, 61,171,420 francs. The budget for 1925 balanced at 16,878,500 francs. From Lome, the seat of the government, there are railway connections with Anecho, Palime, and Atakpame, with a total length of 204 miles. In 1924, 310 vessels cleared from the two ports of Lome and Anecho.

**TOLEDO,** UNIVERSITY OF THE CITY OF. An institution of higher education at Toledo, Ohio;

founded in 1872. The enrollment for the autumn of 1926 totaled 1456, including 649 day students, 203 afternoon, and 604 evening students. There were 270 students registered for the summer session. The faculty had 69 members, an increase of 7 over 1925. The productive funds of the University amounted to \$200,000. The library contained about 20,000 volumes. Following the death of President Dowd on May 13, 1926, Dr. Ernest Ashton Smith was chosen President, and entered on his duties December 1, although his inauguration date was set for some time in January, 1927.

**TONGA OR FRIENDLY ISLANDS.** Three groups of islands, together with small, outlying islands, to the east of Fiji in the Pacific Ocean, between 15° and 23° 30' S. latitude and 173° and 177° W. longitude; since May 19, 1900, a protectorate of Great Britain. Total area, approximately 385 square miles; population, according to the census of 1921, 23,759 Tongans; 370 other Pacific islanders; 571 Europeans; and 235 half-castes. The natives are Christians, about 16,000 belonging to the Free Church of Tonga. At the end of 1924 there were 105 public primary schools, with 4600 pupils enrolled. Tonga College had 8 teachers and 161 students at the end of 1924. Native produce consists almost entirely of copra. Revenue in 1924-25, £74,345; expenditure £63,585; exports, £306,658; imports, £232,600. The government is under the high commissioner of the Western Pacific, who acts by the advice of the local ruler and native chiefs. Queen in 1926, Salote, who succeeded April 12, 1918; high commissioner for the Western Pacific, Sir Cecil Hunter Rodwell.

**TONGKING**, tōn'kēn. A French protectorate, constituting the northern chief division of the colony of French Indo-China, south of the Chinese provinces of Kwangsi and Yunnan. Area, 40,530 square miles; population in 1924, 7,160,113, of whom 10,113 were Europeans, exclusive of military forces. The chief city is Hanoi, which is the capital of French Indo-China, with a population of 115,000 in 1923. The chief crop is rice, although there is also a large annual production of raw silk. The mineral resources include limestone quarries, calamine, and tin mines, as well as rich anthracite coal beds. Among the principal imports are metal tools and machinery, yarns, and cotton. The chief exports are rice, corn, and animal products. Imports in 1924, 492,003,265 francs; exports, 372,153,000 francs. The local budget for 1925 balanced at 16,139,030 piastres. In 1924, 1019 vessels of 1,338,216 tons entered and cleared from the port of Haiphong. The government is under a resident superior, who in turn is under the governor-general of French Indo-China.

**TOPAKYAN**, HAGA ZOUNE HOHANNES. Former Persian consul-general and Oriental rug merchant, died in New York, N. Y., on October 14. He was born in Constantinople, Turkey, on Nov. 5, 1864, and was educated at the public schools there and at the American College in Turkey. After experience he engaged in his father's dry goods business. In 1887 he left Turkey for the United States. He engaged in business in New York City, and he was appointed, by the Persian Government, Imperial Commissioner and Director General of its exhibits at the World's Columbian Exposition

held at Chicago in 1893. The Persian and Ottoman pavilion there was built at his expense. In 1908 he was consul general for Persia at New York. He made many gifts of rugs and carpets to the White House. He had Persian, Turkish, and Venezuelan decorations and in 1911 he was vice president of the International Peace Forum, and in 1915 he was Persian Commissioner General to the Panama-Pacific International Exposition.

**TORLONIA**, PRINCE AUGUSTO. Italian nobleman, died at Milan, Italy, April 17. He was born in 1855 of a family established about a century ago, but allied by marriage to many of the oldest families of the Roman patriciate. His name will ever be recalled in connection with the draining of the Lacus Fucinus (modern Lake Fucino), which had for centuries caused death and destruction to the surrounding country. From the time of the Cæsars many unsuccessful efforts had been made to drain this lake but it was only accomplished when the fortune of the Torlonia family and French engineering skill were brought to bear. A tunnel through solid rock, hundreds of feet below the surface and eight miles long, was made, and the lake drained into the River Liris. This draining of the lake added an area of more than 100,000 acres to Italy's cultivable domain.

**TORONTO**, UNIVERSITY OF. An institution of higher education at Toronto, Canada, supported by the provincial government; founded in 1827. The 1926 fall enrollment was 5068, distributed as follows: Arts, 2608; medicine, 760; applied science and engineering, 485; household science, 101; Ontario College of Education, 210; forestry, 51; music, 40; graduate students, 335; dentistry, 322; social service, 98; public health nursing, 32; university extension (occupational therapy), 26. In 1925-26 the faculty had 672 members, as follows: Professors, 85; associate professors, 63; assistant professors, 62; directors, 2; lectures and associates, 123; demonstrators, 336. The total expenditure for the year 1925-26 was \$2,454,355. The library contained 211,118 volumes. During the year a two-year diploma course in occupational therapy was started, and the St. George School for Child Study founded, under the direction of the department of psychology. In 1925 the new Forestry Building was completed at a cost of approximately \$122,000. In 1926 there were under construction a Hygiene and Public Health Building, to cost about \$432,000; an addition to the Press Building, to cost \$43,000; and a Hockey and Skating Arena, to cost \$224,000. Among the gifts received during the year were \$312,500 from the Rockefeller Foundation for the School of Hygiene; the annual payment of the Eaton Endowment, \$25,000; \$12,000 for the Laura Spelman Rockefeller Memorial for Child Research; subscriptions for the Banting Research Foundation, \$420,015; and other smaller contributions which brought the total gifts received to \$799,622.45. President, Sir Robert A. Falconer, K.C.M.G., Litt.D., D.D., D.C.L., LL.D.

**TORPEDO BOATS.** See VESSELS, NAVAL.

**TOSELLI**, ENRICO. An Italian pianist and composer, died in Florence, January 15. He was born in the same city, Mar. 13, 1883, and studied under Sgambati and Martucci. He made extended tours as a pianistic prodigy, visiting the United States in 1900. An operetta, *La principessa bizzarra*, was produced in Milan

(1913). He also wrote a symphonic poem and several suites for string quartet. He married in 1907, the divorced Crown Princess Louise of Saxony, who, in turn, divorced him in 1912.

**TOUCHET, CARDINAL ARUBO.** Bishop of Orleans, France, died on September 23, at Orléans, France. He was born Nov. 13, 1848, at Bayeux, France, and was entrusted by Pope Leo XIII with the task of establishing the claims of Joan of Arc to canonization in the Roman Catholic Church. The Cardinal took part in the beatification of Joan of Arc in 1909, and later presented to the Pope a bronze statue of her. He was created a Cardinal in 1922.

**TOWN PLANNING.** See CITY PLANNING.

**TOWNSLEY, CLARENCE PAGE.** American army officer, died at Washington, D. C., December 28. He was born at DeKalb, St. Lawrence County, N. Y., September 24, 1855, and after graduating at the State Normal School at Potsdam and at Union College, entered the United States Military Academy from which he graduated in 1881, being commissioned second lieutenant in the Fourth United States Artillery. He rose through successive grades in the army, attending the Artillery School at Fort Monroe and the Torpedo School at Willetts, N. Y. During the Spanish-American War he served as chief ordnance officer. He was commandant of the Coast Artillery School at Fort Monroe, 1909-11, and of the Second Provisional Regiment of Coast Artillery in Texas in 1911. He served as superintendent of the United States Military Academy from Aug. 31, 1912 to July 1, 1916, and in the following year, after the United States entered the World War, was appointed commander of the Thirtieth Division. In January, 1918, he went to France on a tour of observation, and later in the year took command of the artillery district of the North Pacific with headquarters at Seattle, retiring from active service as brigadier-general, U.S.A., Nov. 29, 1918.

**TRACK ATHLETICS.** See ATHLETICS, TRACK AND FIELD.

**TRADE-UNIONS.** The history of American trade-union activities over the year will be found under LABOR, AMERICAN FEDERATION OF, and in the general article LABOR. The work of the International Labor Office is narrated in the article LABOR, INTERNATIONAL ORGANIZATION OF. Other phases of domestic and foreign trade-union activities are treated below.

**GREAT BRITAIN.** The 58th annual meeting of the British Trades-Union Congress was held Sept. 6 to 11, 1926. The atmosphere of the congress was much sadder than that of the last meeting. In the interim had taken place the general strike (see under GREAT BRITAIN; *History*) and the long drawn out coal strike, which, moreover, was still unsettled at the time of the congress. Whatever may have been the thrill of battle, the trade-unionists had to face the fact that they had exhausted all their funds in the nine-day struggle. They had also to face the fact that there were 3,000,000 unemployed (including the miners on strike), and that the government had at length taken the side of the owners in the coal strike. In the circumstances, the administration of the congress restricted discussion, and little mention was made of the general strike. A report published after the congress adjourned criticized the attitude of the miners in precipitating the

strike, and the anti-labor press saw in this a sign of division in labor ranks.

The general council, which the year before had asked for a broad increase of its powers, this year did not want any more powers added to it. Nor was the congress itself inclined to grant any new powers to the council. On all hands there was a general inclination to go slow in the future.

A certain amount of tension was evident in the relations between the officials of the Miners' Federation and the rest of the congress. A. J. Cook, the miners' general secretary, was inclined to lecture the congress on its failure to do its duty by the miners. He proposed a compulsory general levy. The congress, however, while deeply sympathetic with the plight of the miners and their families, thought such a levy inadvisable. The railway and transport workers also objected to another proposal of the miners calling for an embargo on coal transport. They felt that such a thing could not be carried through without a national stoppage of work.

A curious incident arose in the receipt of a telegraphic message by L. Tomsky, the head of the Russian unions, to the congress. M. Tomsky was to have been the Russian delegate at the congress, but at the last moment the British government declined to visé his passport. Therefore he contented himself with sending a propaganda plea for revolutionary Communism and the seizure of power by the working class. The congress did not take kindly to the invitation, and even the "left wing" kept quiet. The congress decided to delay the opening of the new Trade Union College. It was evident that the delay was caused by the financial exhaustion of the unions in the general strike.

**ITALY.** The reorganization of the Italian labor unions on a Fascist model, which Mussolini began by law in 1925, was completed in 1926. The *Official Gazette* published early in the fall a list of regulations governing the application of the law establishing legal control over the collective relations of capital and labor, and also a decree creating the new Ministry of the Corporations. These regulations and the decree clearly indicated that Fascist Syndicalism was an accomplished fact.

The Fascist system of labor control has to be understood both in theory and in practice. In theory the state takes no sides between capital and labor, between associations of employers and associations of workmen. Both are officially recognized and put under the control of the state. The labor unions are forbidden to strike, and the employers' bodies are forbidden to use the lockout. A system of compulsory arbitration is enforced on both groups. The groups are subject to severe fines for violating the law, and in many cases the leaders can be imprisoned. Thus, in theory we have a Syndicalist system, with the state intervening to assert the general will and to defend the public interest.

In practice, however the Fascist system has to be understood as favoring the employers, by whose contributions Fascism was originally launched. As is stated in *Special Circular No. 10* issued by the United States Bureau of Foreign and Domestic Commerce, "the employers are readily complying with the new law, the

employees reluctantly." The same circular goes on to state:

The existing associations of employers have all been preparing to comply with the conditions laid down, and have been preparing for their legal recognition, without which they would be practically powerless. On the other hand, the situation, so far as the labor unions are concerned, has been entirely different. The old Socialist unions, which until a few years ago exerted such a dominant influence in Italian affairs, find themselves practically legislated out of existence, since recognition will be accorded only to the new unions which have come into being since the advent of the present government. Since all those belonging to a group are required to contribute to the support of the association legally representing their group whether they are members of such association or not, they will naturally become members wherever possible, in order to enjoy whatever advantages such a status may imply. Regardless of their political convictions, the former Socialists are rapidly swelling the ranks of the Fascist unions, and their strength is such that they may eventually exercise a considerable influence in the determination of policies. The funds at the disposal of these unions will be large, and they will represent a force that will have to be reckoned with.

While it is thus evident that the Fascist system, on paper, cannot be taken as indicating the actual relations of capital and labor in Italy in 1926, the provisions have an importance in themselves, since they may continue in force long after the existing political situation disappears. The provisions of the system of regulations is summarized herewith, according to the circular of the Bureau of Foreign and Domestic Commerce:

1. *Conditions for Recognizing Associations.* The law provides for the legal recognition, by the state, of one organization representing each group of society according to occupation, either employers or workers, both manual and intellectual, and of federations of such organizations. In order to be eligible for recognition, an employers' association must comprise a voluntary membership of firms employing together not less than one-tenth of the workers employed in that particular field; an association of workers must have a voluntary membership of one-tenth of the workers in the particular field. The election or nomination of the presidents or secretaries of all associations, national, district or provincial, must be approved by royal decree, and is revocable at any time. Their selection must be proposed by the appropriate minister, in collaboration with the Minister of the Interior.

2. *List of National Confederations Recognized.* The associations legally recognized may unite in federations or confederations, one of which for each group may be legally recognized. When such a federation or confederation has been recognized, no association or federation which does not form a part of it is entitled to recognition. The national confederations are limited to 13, one for each of the accompanying groups:

*For the Employers*

1. Manufactures.
2. Agriculturists.
3. Merchants.
4. Ocean and aerial transportation.
5. Land and inland water transportation.
6. Bankers.

*For the Workers*

7. Industrial workers and employees.
8. Agricultural workers and employees.
9. Commercial workers and employees.

10. Ocean and aerial transportation.
11. Land and inland water transportation.
12. Banking workers and employees.

*For the Liberal Professions*

13. Professional people and artists.

3. *Central "Corporations."* Provision is made for uniting the national associations of employers, intellectual workers and manual workers through a central body, made up of representatives of each class, called a Corporation, which is created by the decree calling into being the new Ministry of the Corporations already mentioned. These corporations have no independent legal status, and are defined in the law as "organs of the administration of the state." Their principal functions are to conciliate disputes, promote greater production, establish employment offices, issue regulations governing apprentices, etc.

4. *Collective Contracts.* Only collective labor contracts concluded by legally recognized associations shall be valid, these being binding on all members of the group concerned. These contracts are to be in writing, and must be made public. Labor associations, collectively, shall be responsible for breaches, and may be sued in the civil courts. Members are responsible only in so far as they have failed to do everything in their power to comply with the law. No collective agreements are permitted in cases of personal or domestic service.

5. *Labor Courts.* All disputes are placed under the jurisdiction of the courts of appeal, serving as labor courts. However, before any decision is rendered an attempt at conciliation must be made by the president of the court. At each court of appeal a special labor section is created, composed of three magistrates and two private citizens expert in labor problems.

6. *Conditions of Court Settlement.* Emphasis is laid in the laws on the viewpoint that in making decisions the superior interests of production must take precedence over those of either group, of labor or employers. This provision is designed to allay the fears of manufacturers that the labor courts will yield too readily to pressure from the laboring classes. Another provision of interest is that local conditions are to influence wage decisions. Disputes may still be settled by conciliation or arbitration without having recourse to the labor courts.

MEXICO. A membership of 1,500,000 was enrolled in the Mexican Federation of Labor (Confederación Regional Obrera Mexicana). The C.R.O.M., as the organization is generally known, held its seventh annual convention at Mexico City, May 1-6, 1926. Statistics made public at the convention traced the phenomenal rise of the organization from a membership of 7000 in 1918 to the figure given. The movement of unionization among the Mexican workmen showed no sign of diminishing, and the leaders did not believe that the high-water mark of enrollment had yet been reached.

Perhaps the most important resolution of the convention was that calling into being an Institute of Social Science, or workers' college, which was to be maintained by the C.R.O.M. Still other resolutions called for the formation of labor and farm loan banks, and for the adoption of the Rochdale system of coöperation for the construction of houses, as well as the or-

ganization of consumers' coöperatives on the basis of production.

CANADA. The Dominion Department of Labor made public the accompanying figures on trade unions in Canada during 1925:

	Branches	Members
International craft unions .....	1,985	172,578
Industrial Workers of the World ..	6	10,000
One Big Union .....	58	17,256
Non-international organization ....	311	34,070
Independent unions .....	40	12,185
National and Catholic unions .....	99	25,000
Total .....	2,494	271,064

\* For 34 branches.

The membership in the international craft unions shows a drop of 17,908 from 1924. The non-international organizations and the independent unions gained 12,309 and 264 members, respectively. The national and Catholic unions remained unchanged in strength, while the I. W. W. lost 1500 members as compared with the previous year. The One Big Union report is the first since the War, and no comparative figures are available for that organization.

INDIA. The sixth session of the All-India Trade Union Congress was held at Madras, India, Jan. 9-10, 1926. There were 110 delegates present, and these represented 52 unions with a combined membership of over 125,000. The 52 unions are divided as follows: Railway men, 15; textiles, 10; general laborers, 7; transportation other than railroads, 7; seamen, 3; posts and telegraphs, 2; commercial employees, 2; paper and printing, 2; engineering, mining, iron and steel, chemical industries, 1 each. All these unions have been organized since 1918. The session passed a number of resolutions on economic and political subjects. In the political field may be mentioned the resolution calling for the adequate representation of labor in the central and provincial legislatures, the representation to be elective and not appointive. Chief among the economic demands were the eight-hour day, public employment bureaus, maternity benefits, and other forms of protection for women in industry. The congress also protested against the discriminatory legislation passed by the Union of South Africa, and decided to appeal to the South African Labor Party, in the name of international solidarity, to help repeal legislation of this type. See GREAT BRITAIN under *History*.

TRANSJORDANIA. A territory of Asia Minor inhabited by Arabs, of which the territorial and political status was still unsettled in 1926, although nominally under the mandate of Palestine; situated to the east of the Jordan and north of the Arab dominions of the Hedjaz and Nejd. The area is uncertain because of the unsettled boundaries; the population has been estimated at 240,000, of whom 220,000 are Arab Moslems. About half the population are nomads, the rest living in villages. A large part of the surface is desert. In the arable regions the principal pursuits are agriculture and stock raising. The estimated revenue for 1925-26 was ££51,670 and the grant-in-aid from the British government ££14,479. In 1923 the British government recognized the local Arab rule on condition that it should conform to constitutional principles and receive the approval of the League of Nations. Up to 1926 this approval had not been obtained. The general responsibility for

Transjordan rests with the high commissioner for Palestine, who is represented in the country by an agent. The Emir in 1926 was Abdullah Ibu Hussein.

TRANSPORTATION. See RAILWAYS.

TRANVAAL. See SOUTH AFRICA, UNION OF.

TRANSYLVANIA. A portion of the Hungarian crownlands until taken over by Rumania in the latter half of 1918; formally annexed to Rumania by royal decree, Jan. 1, 1919. Area, 22,312 square miles; population, at the census of 1919, 2,678,367.

TRAVEL. See LITERATURE, ENGLISH AND AMERICAN.

TREATIES. See INTERNATIONAL LAW: ARBITRATION, INTERNATIONAL.

TRENTON, BATTLE OF. See CELEBRATIONS.

TRIESTE, tré-ést. A former crownland of Austria; occupied by Italy after the War, and retained by Italy under the peace settlement; including the port of Trieste and surrounding regions. Area, 37 square miles; population, at the census of Dec. 1, 1921, 238,655.

TRINIDAD. A West Indian island north of the mouth of the Orinoco River, constituting, with Tobago, a British colony. Area of Trinidad, 1862 square miles; of Tobago, 114; total population, according to the census of 1921, 365,913; estimated at the end of 1924, 381,753. Capital, Port of Spain, with a population in 1924 of 63,954. The white population is chiefly made up of French, British, Spanish, and Portuguese, while the majority of the natives are West Indians of African descent. East Indians in 1923 were estimated at 122,363. English is the prevailing language. In 1924 the movement of population was: Births, 12,791; deaths, 7609; marriages, 1406. In the same year there were 202 elementary (and 48 government) schools, with an enrollment of 56,985 pupils and an average daily attendance of 35,012. About 541,682 acres were under cultivation in 1924. A celebrated feature is the asphalt lake, the revenue from which in 1924 was £74,050. The petroleum industry is of prime importance, the output in 1924 being 141,981,420 imperial gallons of crude oil. There are a number of refineries and other plants for the manufacture of oil fuel, kerosene, etc. The imports in 1924 were valued at £4,287,943; exports, £4,893,863; revenue, £1,586,834; expenditure, £1,572,765; public debt, £3,406,753. The total shipping which entered and cleared in 1924 was 4023 vessels of 4,043,236 tons. On the island of Tobago, which is visited by considerable numbers of American and British tourists, the culture of rubber, tobacco, and cotton has been introduced. Trinidad is under a governor who is aided by an executive council and a legislative council. Governor in 1926, Sir Horace Archer Byatt.

TRINITY COLLEGE. An institution for the higher education of men at Hartford, Conn. For the fall term of 1926 the enrollment was 246, distributed as follows: graduate students, 8; seniors, 35; juniors, 51; sophomores, 68; freshmen, 74; non-matriculants, 10. There were 31 members on the faculty. The endowment fund of the college amounted to \$2,733,970, and the income for the year to \$214,000. Gifts received during the year amounted to about \$25,000. There were approximately 100,000 volumes and 40,000 pamphlets in the library. President, Remsen B. Ogilby, Litt.D., LL.D.

**TRINITY COLLEGE.** An institution at Durham, N. C., now a part of DUKE UNIVERSITY (q.v.).

**TRIPOLITANIA.** An Italian territory on the north coast of Africa; until 1919 a part of Italian Libya. In that year, for administrative purposes, Libya was divided into Tripolitania and Cyrenaica (q.v.). Area, estimated at 350,000 square miles; population, according to the census of 1921, about 550,000 natives and 20,716 Europeans, of whom 18,093 were Italians. The land is rather barren, but supports some palm, lemon, olive, and fig trees. The imports in 1924 were 198,672,038 lire; exports, 25,204,132 lire; colonial revenue for 1924-25, 146,841,000 lire; civil expenditure, 34,477,500 lire; military expenditure, 112,364,600 lire. The chief means of transportation is along caravan routes to the interior. There are also about 140 miles of railway. Tripoli, with a population of approximately 60,000, is the capital. Governor in 1926, General Emilio de Bono.

**TROTting.** See RACING.

**TRUCK FARMING.** See HORTICULTURE.

**TRUDELLITE.** See CHEMISTRY under *Mineralogical Chemistry*.

**TUBERCULOSIS.** A bulletin was issued by the United States Department of Commerce on October 5, showing the death rates from tuberculosis for 1924. It was accompanied by a comparative tabulation which incorporates the mortality for 1900, 1910 and 1920. This shows a steady decline in both the crude and adjusted rates, and for both sexes and all of the age periods. This table is so significant that it is reproduced intact herewith. The decline is not peculiar to the United States, but is also apparent in the vital statistics of England and Wales.

In the evolution of our knowledge of tuber-

culosis, it is necessary at times to take an account of stock. This was done by Prof. A. Schmincke of the pathological department of the University of Tübingen, in the *Muenchener Medizinische Wochenschrift* for July 25. The infinite variability of the manifestations of the disease make every case a law to itself, and before the practitioner can become oriented in the individual case much research will still be necessary. Tuberculosis follows the laws of infectious diseases in general, and after it has been contracted the entire organism participates at a very early period, as shown by studies in immunity. It is a most regrettable fact that a primary tuberculous deposit in the lungs is

peculiarly prone to infect the entire organism, while in certain localities, as the tonsil, conjunctiva, and middle ear, the tendency is for it to remain localized. In a majority of cases this pulmonary deposit goes back to early childhood, and so susceptible is mankind under these circumstances that a very few bacilli are sufficient to convey the disease. However, the organism makes a strong defense against the invader, and in fully 50 per cent the infected subjects form immune bodies which arrest the further extension of the disease, so that Nature may be said to have effected a successful vaccination of the patient against later invasions.

This 50 per cent which have been naturally immunized live out their normal expectancy of life, and are perhaps even better immunized against further tuberculosis than those who have never contracted the disease. The immunizing process may consist in part of hermetically sealing living bacilli in the original foci of the disease, by the formation of a fibrous capsule, the process requiring about six weeks. Although the bacillus is thereby rendered quite harmless for the time, it is possible that at some later period it may be set free and cause further mischief—for second infections do occur at times either from new invasion from without or mobilization of germs which lie quiescent in the body—which indicates that the protection from the act of immunization has expired.

The 50 per cent who do not develop complete immunity are still for the most part able to wage defensive war against the parasites, and the infinite variety of symptoms is an indication of the status of the struggle between the destructive and the defensive forces. In very rare cases in which the defense is impotent, death may result in a few days or weeks from some one of the manifestations of acute tuberculosis.

DEATH RATE FROM TUBERCULOSIS (ALL FORMS) PER 100,000 POPULATION IN THE REGISTRATION STATES OF 1900

Age period	1900		1910		1920		1924	
	Male	Female	Male	Female	Male	Female	Male	Female

**TUCK, SIR ADOLPH.** British art publisher, died in London, July 3. He was born Jan. 30, 1854, and was educated at the Elizabeth Gymnasium, Breslau, Germany. He entered his father's art publishing business in London in 1889, and he inaugurated the first of a series of original Christmas card designs exhibitions at the Dudley Gallery, with Sir Coutts Lindsay, John Everett Millais, R.A., and Marcus Stone, R.A., as judges, in 1879. He introduced picture postcards into the British Empire in 1894. He was the first baronet, the title having been created in 1910. At the time of his death he was

Chairman and Managing Director of Raphael Tuck and Sons Ltd., extraordinary director of the Scottish Equitable Life Assurance Society, and treasurer of the Jews' College.

**TUCKER, WILLIAM JEWETT.** President emeritus of Dartmouth College, died September 29, at Hanover, N. H. He was born at Griswold, Conn., July 13, 1839, and graduated from Dartmouth College in 1861. After graduation from Andover Theological Seminary and ordination in the Congregational Ministry he went to a charge at Manchester, N. H., and in 1876 he accepted a call to the Madison Square Presbyterian Church in New York, where he remained until 1880. He then returned to Andover, where in sympathy with the liberal movement in theology he developed religious teaching as a practical force. He advocated sociological training for his students, and he was a founder of Andover House in Boston, believed to be the first social settlement in New England. In 1875 he received the honorary degree of D.D. from Dartmouth College, and the same honor from Vermont University in 1904. The honorary degree of LL.D. was given him by Williams in 1893, by Yale in 1895, by the Wesleyan University in 1903, and by Columbia in 1906. In 1894 Dr. Tucker delivered the lectures of the Lowell Institute in Boston, and from 1899 to 1901 he was a University preacher of Harvard. In 1897 he was a lecturer of the Union Theological Seminary, and in 1897-98 he was Lyman Beecher Lecturer of the Yale Divinity School. From 1893 to 1909 he was President of Dartmouth College; under his charge the college grew rapidly. In 1909 Dr. Tucker resigned his active presidency of the College. He wrote much, his more important works being: *Liberty to Unity* (1892); *The Making and Unmaking of the Preacher* (1899); *Public Mindfulness and Personal Power* (1910); *The Function of the Church in Modern Society* (1911); *The New Reservation of Time* (1910); and an autobiography under the title of *My Generation*, published in 1919.

**TUFTS COLLEGE.** A non-sectarian co-educational institution at Tufts College, Medford, Mass.; founded in 1852. It is comprised of the school of liberal arts, Jackson College for women, the engineering school, School of Religion, Crane Foundation, and the medical and dental schools. The registration for the fall term of 1926 was 2207. There were 417 members on the faculty. The productive funds amounted to \$7,210,513.50, and the income for the educational departments for the year to \$746,318.75. The library contained about 90,000 volumes. President, John Albert Cousins, LL.D.

**TULANE UNIVERSITY OF LOUISIANA.** An institution of higher education, located at New Orleans, La., founded in 1834, and having a separate undergraduate department for women, though co-educational in the professional schools. The total enrollment for the fall term of 1926 was 2849, distributed as follows: college of arts and sciences, 518; college of engineering, 249; H. Sophie Newcomb college, 713; graduate school, 89; law, 83; medicine, 416; graduate medicine, 20; dentistry, 42; pharmacy, 30; commerce, 524; courses for teachers, 165. The registration for the summer school of 1926 was 1556. The faculty numbered 402. The productive funds for the fiscal year 1925-26 amounted to \$6,987,555.17, and the income for the year to \$935,009.

65. The value of grounds, buildings, and equipment was \$4,277,582.40. The number of volumes in the library was more than 112,000. During the year a Department of Journalism was established under the gift of the *Times-Picayune* of \$8000 per annum for ten years. A new concrete stadium was erected at a cost of approximately \$330,000, with a seating capacity of more than 25,000. Dr. Marcus Feingold bequeathed his ophthalmologic library to the University, and Judge Joseph A. Breaux bequeathed one-half of the residue of his estate to establish scholarships. At the end of the year the exact amount of the latter gift was not yet known. President, A. B. Dinwiddie, Ph.D., LL.D.

**TULAREMIA.** This new contagious disease was described in the YEAR BOOK for 1924. In the *Journal of the American Medical Association* for May 1, Francis, who first described the affection, announced its identity with a newly recognized malady of Japan known provisionally as Ohara's disease. The Japanese, who practiced medicine in Fukushima, published during 1925 an account of an acute febrile disease which is transmitted by wild rabbits. It was never known to occur before January, 1924, although special investigation seemed to show that it had existed in certain restricted areas for a score of years. It was apparently contracted from dressing the killed animals, and possibly also from eating the meat when insufficiently cooked. The virus of the disease enters through the skin of the fingers, judging from the initial swelling of the lymph nodes at the elbow and in the axilla. Although the fever was known to last a week or more and to reach at times 104° F, there were no fatalities and no serious complications. Mrs. Ohara, wife of the physician, volunteered to submit to an inoculation. Blood from a dead rabbit having been rubbed into the back of her hand, fever first appeared on the fourth day, after tenderness in the armpit, and lasted nine days. Blood serum from Japanese patients sent to Dr. Francis was found to agglutinate the American *Bacterium tularense*, and the latter was also recovered from tissue sent at the same time.

In an editorial entitled "Courageous Devotion of Scientific Investigators," in the *Journal of the American Medical Association* for December 11, it was announced that the United States Public Health Service has regarded tularemia as of sufficient importance to maintain a special laboratory, for the study of this affection, at Hamilton, Mont. Francis, of the Public Health Service, referring to numerous co-workers in widely separated States, calls attention to the fact that "tularemia is the only disease in man that has been elucidated from beginning to end by American investigators alone." Eighteen cases have occurred in laboratory workers engaged in its study, including entomologists who are investigating the ticks or insects which are believed to transmit the contagion. The editor is silent as to the occurrence of the disease in Japan (mentioned above) which seems to antagonize the statement of exclusive American discovery.

**TUNIS.** A French protectorate in North Africa, known as the Regency of Tunis; situated on the Mediterranean coast east of Algeria, bounded on the south by the Sahara and Libyan desert. The area is estimated at 48,300 square miles; population, according to the census of 1921, Europeans, 156,170, natives, 1,938,920. The

capital is the city of Tunis, with a population in 1921 of 171,672; other towns are Sfax, 27,921, and Bizerta, 20,763. In 1925 there were 405 public schools, including 8 lycees and colleges, and 32 private schools, of which 6 were Jewish schools provided by the government. The total number of pupils in the schools was 58,222. There are, besides, numerous Mohammedan schools, some of which are assisted by the state.

Agriculture is the principal industry, and the chief crops are wheat, barley, and oats. The soil is well adapted to fruit culture, and in the south dates are especially abundant. Olive trees abound in many parts of the country. The area under wheat in 1924 was 1,172,500 acres, production, 141,000 tons; barley, 754,395 acres, 55,000 tons; oats, 116,857 acres, 23,000 tons. There were 15,654,347 olive trees, the produce of which is about 30,500 tons of oil yearly. In the same year 1,034,251 date trees produced 79,295,286 pounds of dates. The livestock consisted of 71,608 horses; 122,435 asses; 21,427 mules; 333,955 cattle; 1,378,840 sheep; 797,970 goats; 119,366 camels; and 13,916 pigs. Among the native industries are spinning and weaving, pottery making, saddle making, etc. The mineral resources include lead, zinc, and iron ore, and especially phosphates.

Imports in 1925 totaled 1,086,270,800 francs (\$51,190,500) and exports 846,225,800 francs (\$30,943,400). The import figures in 1924 were \$49,306,300 and the exports \$30,943,400. The share of France in the total trade of Tunis amounted to about 57 per cent. The most important item of exportation from Tunis was phosphate fertilizers. Exports of other mineral products were satisfactory, with the exception of iron ore, which declined 12 per cent from the previous year. The exportation of olive oil was stimulated both by good local consumption and by insufficient yields in other producing countries.

The revenue for 1925 was £10,251,169 and the expenditure £10,238,787. The main sources of revenue were from direct and indirect taxes and from the tobacco and other monopolies. The chief expenditures were for the finance, public works and education departments. In 1924, 10,267 vessels entered the ports of Tunis. The railway mileage in the same year was 1586, of which 622 miles were broad gauge. The Bey of Tunis in 1926 was Sidi Mohamed, who succeeded July 10, 1922. The government, known as the Regency of Tunis, is under the French foreign office, which is represented by a resident-general. The administration is a mixture of French and native institutions. Resident-general in 1926, Lucien Saint, who was appointed Nov. 24, 1920.

**TUNNELS.** During the year progress was made on two important railway tunnels in the United States, while the Holland Tunnel for vehicles between New York and New Jersey was rapidly nearing completion. There were the usual number of tunnels for irrigation projects under construction, and subaqueous tunnels in connection with rapid transit or other projects. Some of the more notable construction of the year in this field is considered in the following paragraphs.

**MOFFAT TUNNEL.** At the end of the year the Moffat Tunnel, a rock tunnel six miles in length under the north shoulder of James Peak, Colo., 50 miles from Denver and piercing the Continen-

tal Divide at an elevation of 9200 feet, was rapidly nearing completion, the pioneer tunnel being 97 per cent finished, the main headings 91 per cent, and the full tunnel section 79 per cent. It was expected that the main headings would be holed through in March and the entire tunnel completed by the contract date, July 20, 1927. The excavation from the east end was in solid granite and progressed rapidly until February, 1926, when, after passing the summit, a heavy inrush of water delayed progress. On July 30 a fatal accident occurred in the head of the main tunnel, resulting in the death of six workmen engaged in erecting equipment for further advance. A huge block of rock crashed through the temporary timber support and staging without any warning to the crew working below. At the west end, work proceeded through shattered and seamy rock, requiring heavy timbering. This tunnel was financed by special assessment and leased to the Denver and Salt Lake Railway. See *YEAR BOOK* for 1922, 1923, 1924 and 1925, article, *Tunnels*.

**HOOSAC TUNNEL.** An interesting development was completed on November 27 when the Hoosac Tunnel at North Adams, Mass., on the Boston and Maine Railroad was opened for full operation on both east and west bound tracks after enlargement to permit passage of the biggest cars used on American railroads. The Hoosac Tunnel, which is five miles in length, was constructed between 1855 and 1874, and since that time the freight cars have almost doubled in maximum size. The new tunnel enlargement had been carried on during the year without interruption of traffic, in a space of 3 months 20 days, by working three shifts and confining both east bound and westbound traffic to a single track. This enlargement made it possible for the Hoosac Tunnel to accommodate cars with a maximum width at the eaves of 10 feet, 6 inches at a height of 14 feet above the rail. There is a maximum clearance of 16 feet, 3 inches between the top of the rail and the trolley wire. Some 40 trains a day were using this tunnel at the end of the year.

**HOLLAND TUNNEL.** The vehicular tunnel under the Hudson River between New York City and New Jersey was approximately 95 per cent completed at the end of the year. Progress on this project has been noted in previous issues of the *YEAR BOOK*, and the work had reached a stage where it was anticipated that it would be opened for public use some time in 1927. The tunnel consists of twin tubes of cast iron, 29 feet 6 inches exterior diameter, each tube accommodating two lines of vehicular traffic moving in the same direction, as well as a sidewalk for pedestrian use. The north tube accommodates the Jersey-bound traffic and has its entrance at Broome Street, Manhattan, between Hudson and Varick Streets and its exit at 14th and Provost Streets, Jersey City. New York-bound traffic is carried by the south tube having its entrance at 12th and Provost Streets, Jersey City, and its exit at the junction of Canal, Varick, and Vestry Streets, Manhattan. The total length of each tube is approximately 9250 feet, making the tunnel the longest, as well as the largest subaqueous vehicular tunnel in the world. Each roadway is 20 feet in width and the tunnel will have a roadway capacity equal to that of the Williamsburg Bridge across the East River. The estimated capacity of both tubes was placed

at 46,000 vehicles per day, or 15,000,000 vehicles per year.

The construction involved the excavation of 500,000 cubic yards of earth and the erection of 115,000 tons of cast-iron tunnel lining. The cost of the tunnel was to be amortized from the income obtained by charging tolls based upon the prevailing ferry rates. New York State paid for its share of the cost of construction by annual appropriations made by the Legislature, while New Jersey met its proportion of the cost by selling State bonds. The tunnel is ventilated by mechanical means and fresh air is forced into the tunnel roadway through its entire length by means of a continuous opening on either side of the roadway near the bottom, and the vitiated air is exhausted out of the top of the roadway through flues connected with the pierhead and land shafts into the outside atmosphere. The ventilating equipment, as projected, has a capacity of 3,600,000 cubic feet of fresh air every minute, so that adequate ventilation is secured.

**OAKLAND ESTUARY TUNNEL.** A tunnel or subway for street cars and vehicular traffic was started early in 1926 beneath the estuary dividing Oakland and Alameda, Calif. This tube, just under a mile in length, was constructed of precast concrete segments which were built in a drydock and floated to the estuary, where they were sunk and placed and joined by concrete to adjoining segments under water. Each of these segments, of which there were twelve, was 203 feet in length by about 40 feet in diameter and weighed 5000 tons. The contract called for the completion of the work in July, 1928, but by Dec. 1, 1926, 73.3 per cent had been completed in 52 per cent of the contract time.

**KANSAS CITY WATER TUNNEL.** In the heading of the 7½ foot tunnel under construction for the Kansas City Water Distribution System an explosion took place shortly after 5 A. M., September 15, resulting in the death of eight men, the entire shift working in the tunnel at this time. This tunnel was being built to bring water of the Kansas City Distribution System from the new filtration plant in North Kansas City and was 15,500 feet long, lined with concrete, and driven in shale and limestone, some 280 feet below the general ground surface. It passed beneath the Missouri River and across the bottom land to the filtration plant which was under construction in connection with the general project. At the time of the accident about 2000 feet of the tunnel had been concrete lined, and of the remaining 600 feet, some 300 feet was timbered because of poor roof. The accident occurred after repairs had been made to the ventilating apparatus and at a point some 2600 feet from the shaft. It was believed to be due to an explosion of natural gas, but it was impossible to determine the cause.

**OTHER PROJECTS.** During the year the Rove tunnel of the Marseilles-Rhône canal was completed and put in use. See **CANALS**. For the tunnel under the Shimonoseki Straits in Japan, see **JAPAN, Communications**.

**TURBINE, STEAM.** See **STEAM TURBINES**.

**TURKESTAN**, tur'kē-stān'. An autonomous republic in Central Asia, forming a part of the Union of Soviet Socialist Republics; comprising the provinces of Samarkand, Ferghana, Syrdarya, and Semirychiensk. Area, 571,630

square miles; population, according to the census of 1923, 7,201,551, of which 6,130,400 were rural and 1,071,151 urban. Chief towns with their latest available populations: Tashkent (the capital), 271,650; Omsk, 129,442; Kokand, 113,700. The name "Turkestan" is also applied to a dependency of China lying north of Tibet and forming a part of Sin-Kiang or the New Dominion.

**TURKEY.** A republic since Oct. 29, 1923; formerly the Ottoman Empire; occupying a portion of the Balkan peninsula (Turkey in Europe) and a large part of Asia Minor with contiguous territory (Turkey in Asia); since the Treaty of Lausanne, July 24, 1923, comprising in Asia Minor the territory lying within the Caucasian frontier, the northern part of the old Turco-Persian frontier, the frontier between Turkey and Syria extending from Jizira-ibn-Omar on the Tigris to a point near Payas on the Gulf of Alexandretta, and the so-called "Brussels" line between Turkey and Mesopotamia (q.v.); in Europe, Constantinople and eastern Thrace, according to boundaries fixed in the treaty; and, in the Mediterranean Sea, Imbros, Tenedos, and Rabbit Islands. The Grand National Assembly on Oct. 13, 1923, declared Angora to be the capital.

**AREA AND POPULATION.** The area of the present republic of Turkey is estimated at approximately 494,538 square miles. The ministry of health placed the population at 13,357,000 at the end of 1924, but many competent observers declare this figure to be entirely too high, placing the total at about 10,000,000. No census has been taken by the new government. In Turkish returns published early in 1924, the population of the principal cities was given as follows: Constantinople, 880,998; Smyrna, 98,846; Konia, 71,104; Brussa, 64,664; and Adana, 64,110. The population of Angora was given as 35,000.

**EDUCATION.** The schools are directly in charge of the ministry of education, and elementary education is compulsory. The tendency in the republic is to abolish parochial schools and to replace them with government schools. Thus, in 1924, the numerous Moslem schools were closed by order of the government. The government schools comprise primary grades, secondary schools, training schools for teachers, and the university at Constantinople. No statistics on education matters were available for the year.

**PRODUCTION.** The chief pursuit is agriculture; although the soil is very fertile for the most part, the methods of agriculture are very primitive. Among the principal products are tobacco, cereals, mohair, figs, silk, olives, and olive oil, various fruits and nuts, timber and forest products, wool, furs, skins and hides, canary seed, linseed, and sesame. About 21,000,000 acres are under forests, of which acreage about 88 per cent belongs to the state. The fisheries are an important source of income. The mineral resources are rich, but undeveloped. Among the metals worked are chrome ores, silver, zinc, borax, manganese ore, antimony, copper ore, salt, iron, etc. The mineral products include meerschau, asphalt, lignite, mercury, and arsenic. Manufactures are in a primitive stage, and include woolen yarn and cotton spinning.

**COMMERCE.** The following tables supplied by the United States Bureau of Foreign and Domestic Commerce give the latest available information for Turkish trade:

VALUE OF LEADING COMMODITIES IN  
TURKEY'S FOREIGN TRADE  
[In thousand Turkish pounds]

Commodity	1924	1925 (8 months)
<b>Exports</b>		
Tobacco and tobacc	38,784	33,910
Fruits and vegetables	38,316	12,775
Wool and manufactures	13,150	7,069
Cotton and cotton goods	10,465	9,690
Colors, dyes, chemicals, etc.	9,286	6,580
Animal produce and fish	5,584	4,772
Cereals, etc.	5,899	3,211
All others	42,884	29,322
<b>Total</b>	<b>158,868</b>	<b>107,329</b>
<b>Imports</b>		
Cotton and cotton goods	63,572	46,454
Cereals, leguminous and farinaceous preparations	23,008	18,674
Provisions, sugar, and confectionery	17,852	13,723
Metals	16,168	14,497
Wool and manufactures	13,204	9,526
Mineral oils and greases	7,204	5,774
Machinery	6,839	5,518
All others	45,964	41,032
<b>Total</b>	<b>198,611</b>	<b>155,198</b>

GEOGRAPHIC DISTRIBUTION OF TURKEY'S  
FOREIGN TRADE  
[In million Turkish pounds]

Country of origin and of destination	1924			1925 (8 months)		
	Im-ports	Ex-ports	Total	Im-ports	Ex-ports	Total
Italy	41.0	34.9	75.9	26.8	32.9	59.7

FINANCE. The following table, from the *Statesman's Year Book* for 1926, gives the principal items of revenue and expenditure for the fiscal year 1926-27:

Revenue		£T
Direct taxes		67,714,478
Stamp and registration		7,666,000
Customs and spirit taxes		55,838,000
Monopolies		41,786,980
State industries		2,006,000
State lands and forests		10,877,433
Consumption taxes		20,040,000
Miscellaneous		12,886,854
<b>Total</b>		<b>218,315,245</b>
Expenditure		£T
National defense		80,000,000
Finance and Pensions		27,632,395
Public works		25,000,000
Gendarmerie		12,899,000
Debt		14,437,019
Education		7,806,483
Customs		7,032,911
Justice		7,013,722
Interior		6,234,007
Agriculture		6,003,608
Health		6,005,200
Marine		6,000,000
Posts		6,000,000
Public security		4,880,000
Commerce		4,000,000
Other items		13,417,585
<b>Total</b>		<b>233,361,930</b>

COMMUNICATIONS. At the beginning of 1925 there were 139 merchant vessels under the Turk-

ish flag, with a tonnage of 129,443. The length of the railways in January, 1926, was approximately 2173 miles. It was reported in August that 18 tunnels and 33 bridges had been constructed on the 15-kilometer stretch of the Samsun-Sivas Railroad in Asiatic Turkey now open to freight and passenger traffic. Work had also advanced considerably on the construction of the 16 additional tunnels on the stretch between the 15th and 170th kilometer; the cost of grading and laying the rails on this stretch was estimated at approximately \$1,350,000. There still remained to be constructed a distance of 220 kilometers to Samsun; but since the country to be traversed was much less rough than that through which the line has already been constructed, the average expenditure per kilometer will be considerably lower, it was believed, for the rest of the line.

GOVERNMENT. As a result of the revision of the constitution in April, 1924, the Turkish state was declared to be a republic; the religion, Islam; the official language, Turkish; and the capital, Angora. The assembly was to be elected every four years; while, according to article 7, the assembly exercises the executive power through the president of the republic elected by itself and through the council of ministers chosen by him, there is a proviso that the Assembly may at any time control the actions of the government and at any time dismiss it. The president of the republic was to be chosen from among the deputies constituting the national assembly, and his term of office was to be identical with the life of each assembly. He is *ipso facto* president of the assembly and also, in case of necessity, of the council of ministers. He may, however, take no part in the debates of the assembly, nor has he absolute powers to veto legislation or to dissolve the assembly. President in 1926, Mustafa Kemal Pasha. The cabinet which was formed on Mar. 4, 1925, was constituted as follows in 1926: President of the council, Ismet Pasha; interior, Jemil Bey; finance, Hassan Bey; public works, Behij Bey; foreign affairs, Tewfik Rushdi Bey; justice, Mahmud Essad Bey; public instruction, Nejati Bey; public health, Dr. Refik Bey; commerce, Ali Jenani Bey; agriculture, Sabri Bey; marine, Ihson Bey; national defense, Resheb Bey.

HISTORY. For an account of the settlement of the Mosul boundary dispute, see the historical section of MESOPOTAMIA and the article on the LEAGUE OF NATIONS.

Throughout the year there were several instances of the continued westernizing of the Turkish republic, such as the adoption of the Gregorian calendar, of the Swiss civil code, and of the twenty-four-hour day beginning at midnight. There were, in some quarters, serious objections to these modernistic tendencies, but the government pressed them assiduously, and, if some reports can be believed, actually imprisoned or put to death those who failed to conform to the new fashions.

In June there were reports in the press that a serious attempt on the life of Mustafa Kemal Pasha had been unearthed in Smyrna. It was laid at the door of the Progressive Party, which was known to oppose Kemal and his virtual dictatorship over the country. The conspirators were arrested, and fifteen persons, including six members of the Turkish parliament, were sentenced to death. It appeared to outside observers

that the punishment of the men involved were entirely too severe and was dictated largely from political motives. In many cases the court exacted far more severe sentences than the prosecuting attorney asked. Towards the close of the year, reports were rife that the government was going to make overtures to the opposition party with a view to reaching and maintaining political peace.

**TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE.** A non-sectarian co-educational normal and industrial school for the higher education of negroes, at Tuskegee, Ala.; founded in 1881 by Booker T. Washington. The enrollment for the autumn of 1926 was 1695, of whom 695 were women. The summer session had a registration of 907 students. There were 246 members on the faculty, 136 men and 110 women. The endowment fund amounted to \$5,849,398.77, and the income for the year to \$408,877.69. There were 28,000 volumes in the library. President, Robert Russa Moton, LL.D.

**TUTANKHAMEN TOMB.** See ARCHÆOLOGOGY.

**TUTUILA.** See SAMOA.

**TYPHOID FEVER.** In the *Weekly Bulletin* of the Department of Health, City of New York, for September 11, was related an episode which illuminates the rôle of the carrier in keeping alive an infectious disease which might otherwise be exterminated by control of the water supply and by other simple measures. In 1899, a woman who is now a grandmother took care of a sister who died of typhoid fever, although from that time on there was no further evidence of the disease in the family, until the present episode. The woman, believed to have harbored the disease germs without ever having taken the infection, had recently visited one of her granddaughters to help with the care of a new habitation. This granddaughter, now 25 years old, contracted typhoid after the return of the grandmother, and succumbed to the disease. The grandmother's home was visited, and the old lady was found to be a germ carrier, although the well water was not infected. The newly occupied residence of the granddaughter was pronounced sanitary, and the water and milk supplies were found intact. All of the members of the family were found free from the bacillus. The exact route through which the virus passed from the grandmother to the granddaughter could not be traced, but from all that is known of carriers there is little room for doubting that this transmission did actually take place through the common use of household implements.

**TYPHUS FEVER.** In an article by Dr. J. W. Tappan, of the United States Public Health Service, on the protective health measures in use at the United States-Mexico border (*Journal of the American Medical Association*, Sept. 25, 1926) considerable space was given to typhus fever, which has been endemic in Mexico since the Spanish conquest and will sift into the United States whenever an epidemic is of sufficient magnitude to cross the border. The mild form known as Brill's disease had been prevalent in the lower Rio Grande valley in Texas for the previous three years. It is a summer disease, not seeming to spread exclusively by louse infestation, and the mode of propagation does not appear to be known. Sporadic typhus now and then appears along the border in cities west of Laredo, Tex., but there has been no true epidem-

ic of virulent typhus since the conquest of the outbreak of 1915-7. This was not a serious visitation, for there were only 150 cases all told, and but 10 were in citizens of the United States, but it required the united efforts of Federal, State, county and city health officials to suppress it, and it might have proved disastrous under less favorable conditions. Several years previously, the United States took over the border quarantine, and has done splendid work in all directions.

**TYROL, tē-rōl'.** A crownland of Austria before the collapse of the Austro-Hungarian Empire; situated in the Alps; after the War it was divided between Italy and the new Republic of Austria. The former received the southern portion and the latter the northern. Total area before the war, 10,302 square miles; population, 946,613. Area of the Austrian province, 4882 square miles; population, according to the census of 1923, 314,836. For a discussion of the alleged Italianizing of Tyrol, see historical sections of articles on ITALY and AUSTRIA.

**UBANGI-SHARI.** See FRENCH EQUATORIAL AFRICA.

**UGANDA, ō-gān'dā, PROTECTORATE.** A protectorate of Great Britain in East Africa; lying north of Tanganyika. For administrative purposes it is divided into five provinces; namely, Eastern Province, Rudolph Province, Northern Province, Western Province, and Buganda. Area, 110,300 square miles; population, estimated in December, 1924, 3,145,449, composed of 3,136,769 natives, 7229 Asiatics, and 1451 Europeans. About 640,000 of the natives belong to the civilized Baganda, a race converted to Christianity.

The chief product is cotton, which is grown almost entirely by the natives on an area estimated at 572,800 acres in 1924. The other products include cacao, oil seeds, coffee, and para rubber. The total exports for 1924 were £3,897,000, mainly cotton (£3,487,000). The import figures are not available because they are merged with those of Kenya (q.v.). The estimated revenue in 1925 was £1,226,102; expenditure, £1,226,102. There is a railway, 62 miles in length, from Jinja to Namasagali on the Nile; another road about 8 miles in length connects Port Bell and Kampala. During the year, a line from Mbulamuti, to connect with the Uganda railway, was under construction. With the exception of Rudolph Province, the protectorate is directly under the British government, represented by a governor and commander-in-chief, but the native rulers are supported in the management of their own subjects. Governor and commander-in-chief in 1926, Sir W. F. Gowers.

**U'KRAINE.** A region known officially as the Ukrainian Socialist Soviet Republic; including the autonomous Moldavian Socialist Soviet Republic (formed in September, 1924) and the following provinces of the former Russian Empire: Kharkoff, Poltava, Chernigov, Kiev, Volhynia, Ekaterinoslav, Odessa, Nikolaiev, Kremenchnug, Donetsk, Zhitomir, and Podolia. Area, 174,510 square miles; population, 21,252,000. Capital, Kiev, with a population, in 1923, of 403,730. The great bulk of the population adheres to the Ukrainian Orthodox Church. In 1924 there were 1723 primary schools, with 10,202 teachers and 198,235 pupils. The soil is fertile, and the chief products are wheat, rye, oats, beets, tobacco, corn, and potatoes. In 1925 there were 4,100,000

horses, 8,000,000 cattle, 9,300,000 sheep, and 3,600,000 pigs. In 1924-25 the budget balanced at 63,508,000 gold rubles. There are approximately 11,070 miles of railways in Ukraine, about two-thirds of which are state-owned; about 2500 miles were reported under construction. The government of Ukraine is modeled on that of Russia (q.v.). At the head of the administration is a council of people's commissars. Chairman of the council in 1926, M. Chubar.

**UNEMPLOYMENT.** According to the report of the Secretary of Labor, 1,791,381 persons were directed to employment through the United States Employment Service during the fiscal year 1926. The Federal service acts as a clearing house for the public employment services of the several States and municipalities. It makes a small financial allotment, provides the registration forms and extends the aid of the franked envelope to these bureaus.

The Secretary of Labor wrote that at the time the report was being prepared employment in the United States was on a satisfactory basis. "The iron and steel industries," he said, "are on an 80 to 85 per cent basis; the automotive industry is employing practically full forces; and a general improvement is registered in the metal and machinery industries, with over-time employment in some parts of the country. A greater volume of employment is noted in metalliferous mining. . . . The rubber industry is on a peak employment basis. Considerable unemployment is noted in the textile and shoe industries and bituminous coal mining, while full employment exists in the anthracite fields. Viewing the country as a whole, building construction craftsmen are on a satisfactory employment basis."

In the closing months of the year an improvement was noticeable in the soft-coal industry on account of the incidental effects of the British coal strike, which provided new markets for about 15,000,000 tons of American coal. (See 'COAL.') On the other hand, there was much broken time in the automotive industries at the close of the year, and there was also a slight let-up in the building industries. The previous bonuses for building workers were ended, and instead there were partial lay-offs of such men.

These general findings were largely confirmed by the statistical studies and estimates published by the Bureau of Labor Statistics. Below is reproduced the general index of employment and wages, prepared by this bureau. From this table it is to be noted that both the employment index and the pay-roll totals for 1926 were slightly higher than for 1925.

**STABILIZATION OF EMPLOYMENT.** The five-day week introduced by Henry Ford in his plants was taken up by the American Federation of Labor at its convention in Detroit. A survey by the *Monthly Labor Review* showed that the five-day week was already prevalent in certain industries, having been introduced gradually through collective negotiations, without loss of wages. The advantages of the five-day week are two-fold. In the first place, it prevents overproduction of goods, and in the second place, it gives the worker a greater opportunity for purchasing goods—this in turn preventing industrial stagnation. This is to omit, of course, the intangible, human benefits of the increased leisure, the economic incidence of which cannot be calculated.

Curiously enough, a survey made in England (as reported in the *Monthly Labor Review*) showed that in addition to the great unemployment in that country, there was a large amount of five-day employment. The chief difference to be noted in the application of the five-day week in England and in the United States is that in the former country it is equivalent to part-time employment, while in America it involves the acceptance of a higher economic standard. Consequently, the five-day week does not have the same effect in England as it has in America, upon economic prosperity.

A study on *Stabilization of Employment* by J. R. Bellerby was brought out this year by the International Labor Office. The author devoted a great deal of comment to the situation in the United States. Characterizing as quite "empirical" the numerous attempts by individual industrial units to deal with the unemployment problem, he sees a great deal of promise in the method of the Federal Reserve System to control credit against over-production. He makes the suggestion that "the evolution of forecasting indexes offers a most fruitful line of progress, for it would allow of prompter and more effective application of the remedies available."

As regards the more direct control of the employment problem, Mr. Bellerby predicted: "The responsibility of the individual worker for his own welfare will be assumed collectively through the medium of the trade union. The responsibility of the community will be born largely by the employer. Working together, these two groups will set up insurance schemes of a very diverse nature. Their joint attempts may at some future date be supplemented by the States or Federal government, by means of additional inducements to set up schemes. There seems no immediate likelihood of public authorities pro-

GENERAL INDEX OF EMPLOYMENT AND PAY-ROLL TOTALS IN MANUFACTURING INDUSTRIES, JANUARY, 1923, TO NOVEMBER, 1926  
[Monthly Average, 1923 = 100]

viding the organization or administrative machinery for unemployment insurance on a general scale."

**UNION COLLEGE.** A non-sectarian college for men at Schenectady, N. Y.; founded in 1795. The 1926 fall enrollment of regular students totaled 757, distributed as follows: academic, 492; electrical engineering, 78; civil engineering, 146; chemical, 26; physical, 15. In addition there were 94 graduate students, and 141 enrolled in extension courses. There were 74 members in the faculty. The productive funds amounted to \$3,015,714.27, and the income for the year was \$605,209.65. During the year 1925-26 the funds of the college were increased by \$91,677.32. In 1926 a physics laboratory and a biology laboratory were erected, and an arts building, to cost \$150,000, was in process of construction. The library contained 63,000 volumes. President, Charles Alexander Richmond, D.D., LL.D.

**UNITARIAN CHURCH.** A denomination believing in one God in one person, and consequently, in the purely human personality of Jesus. Unitarianism as a type of belief is ancient. The Unitarian Church in the United States developed as a modification of Congregationalism in New England, which led to the formation of the American Unitarian Association in 1825. This association is the executive organization of the Unitarian churches to-day. Each church is an independent congregation, and the denomination requires no adherence to a formal creed in its worshippers, and no profession of a particular doctrine in its ministers.

The one-hundred and first annual meeting of the American Unitarian Association was held at Tremont Temple, Boston, Mass., May 25, 1926. On Jan. 1, 1926, the denomination had 422 churches, 376 of which were active. The Unitarian constituency was reported to number 125,336. There were 3193 Sunday school officers and teachers, and 20,717 pupils. Receipts for current church activities, as presented in the treasurer's statement for 1926, amounted to \$722,148.11. General denominational work is carried on by departments, of which the chief are those of publication, religious education, church education, new Americans, foreign relations, and recruiting the ministry. The church sponsors three theological seminaries: Harvard Divinity School; Meadville Theological School, Meadville, Pa.; and Pacific Unitarian School for the Ministry, Berkeley, Cal. Missionary work of the Department of New Americans was carried on among American citizens and residents of Icelandic, Finnish, Norwegian, and Hungarian origin, in particular. The Department of Foreign Relations kept in communication with groups holding similar beliefs in other parts of the world. Denominational publications are: *The Christian Register* (weekly); *The Beacon* (weekly); *The Pacific Unitarian* (monthly); and the *Unitarian Word and Work* (monthly). *The Association* has its headquarters at 16 Beacon Street, Boston, Mass. Its president in 1926 was Samuel A. Eliot; its secretary, Parker C. Marean; treasurer, Henry H. Fuller.

**UNITED BRETHREN IN CHRIST.** A denomination which resulted from the religious awakening of Philip William Otterbein, Martin Boehm, and their co-workers. The church had its beginning at a "great meeting" held about 1766 in the Isaac Long barn near Lancaster, Penn.

The first conference was held in Baltimore, Md., in 1789, and the church was formally organized in Frederick County, Md., in 1800. Its theology is Arminian, and baptism is administered by any mode desired by the applicant, while its beliefs are those of the other evangelical denominations. The church is divided into 35 conferences, including those in China, Japan, the Philippines, Porto Rico, and West Africa. In 1926 there were 3201 organized churches, 1672 itinerant ministers and 398,150 church members, representing an increase of 3890 members over 1925. Sunday Schools, 2989 in number, had an enrollment of 447,402. The amount raised by the church for all purposes in 1926 was \$6,860,812. Home and foreign missionaries numbering approximately 150 were maintained by a conference missionary appropriation of \$102,565 and a General Home Missionary appropriation of \$178,421. The church maintains the following educational institutions: Bonebrake Theological Seminary, Dayton, Ohio; Otterbein College, Westerville, Ohio; Lebanon Valley College, Annville, Pa.; Indiana Central College, Indianapolis, Ind.; York College, York, Neb.; Kansas City University, Kansas City, Kan.; Philomath College, Philomath, Ore.; and Shenandoah College, Dayton, Virginia. Homes and orphanages are the Otterbein Home at Lebanon, Ohio; Quincy Orphanage, Quincy, Pa.; and the Baker Home at Puente, Calif. The printing establishment and headquarters of the church are located at Dayton, Ohio. *The Religious Telescope* is the official paper of the church, and *The Watchword* the young people's paper.

**UNITED CHURCH OF CANADA.** See CANADA, UNITED CHURCH OF.

**UNITED METHODIST CHURCH.** See METHODISTS, WESLEYAN.

**UNITED PRESBYTERIAN CHURCH.** See PRESBYTERIAN CHURCH, UNITED.

**UNITED STATES. AREA AND POPULATION.** The area of the United States, exclusive of Alaska, is 3,026,789 square miles. The area of the non-contiguous lands, which include Alaska, Guam, and certain Pacific islands, Hawaii, the Panama Canal Zone, the Philippine Islands, Porto Rico, American Samoa, and the Virgin Islands (American), is 711,582 square miles, making a total area of 3,738,371 square miles. The estimated population of the United States on July 1, 1926, was 117,136,000. The population, according to the census of 1920, was 106,418,175. This does not include the population of the territorial possessions.

**AGRICULTURE.** Agriculture as a whole attained moderate further improvement, considering its unsatisfactory economic condition, according to the annual report of Secretary of Agriculture W. M. Jardine, which commented on results for the farm year 1926. The most notable exception was that of the cotton producers, whose very heavy crop, the largest on record, brought about a profound depression of current prices. Spring wheat yielded a short crop throughout a great portion of its area, and the quantity deficiency was not alleviated by appreciation of the wheat price, the price being kept down by large winter-wheat production.

The livestock raisers, dairymen and winter-wheat growers were ranked as having fared well, among the larger agricultural groups. The corn belt was ranked as less well off, but as having made some gain toward prosperity. The

Secretary estimated the net income of the agricultural industry of the country for the year at \$2,757,000,000. The rapid growth of agricultural cooperative marketing associations was noted in the report, which placed at 2,700,000 the number of producers holding membership in associations of this description reporting to the Department of Agriculture at the end of 1925. After elimination of duplications, the number of members of cooperative societies was estimated at 2,000,000, or more than treble that in 1915. Sales of the cooperatives had likewise trebled, attaining, in 1925, \$2,400,000,000. A movement of 2,035,000 persons from farms in 1925 was estimated, and the movement of persons in the reverse direction was placed much lower, at 1,135,000.

The Federal Farm Loan Board took action October 7 to help the cooperative financing of storage of excess cotton of the 1926 crop, by offering to extend credit to the amount of \$30,000,000 for this purpose to cotton cooperative financing societies in the cotton states. This proceeding was rendered needful by the production of a crop far greater than any of its predecessors; it was stated at 16,027,000 bales according to the October estimate of the Department of Agriculture, but these figures later were much increased. A cotton committee previously named by President Coolidge to take measures to avert a collapse of cotton prices announced, October 19, its programme to establish and aid financing corporations in each cotton State, to carry among them the estimated 4,000,000 bales of excess cotton until marketable at a higher price.

For statistical and other further data on agriculture in the United States and its dependencies, see the article AGRICULTURE. Important crops are treated in the separate articles CORN, COTTON, WHEAT, etc. See also articles such as AGRICULTURE, U. S. DEPARTMENT OF; AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURAL EXTENSION WORK; DAIRYING; FERTILIZERS; FOOD AND NUTRITION; HORTICULTURE; LIVESTOCK; SOILS; VETERINARY MEDICINE; FORESTRY; RECLAMATION. In the articles on individual States are presented the acreage, production and value of their more important crops in 1925 and 1926.

INDUSTRY AND COMMERCE. The year 1926 was marked by prevailingly favorable developments in industry and trade. While the prices of commodities moved mainly downward through the greater part of the year, and in many cases stood distinctly lower at its close than at its opening, the volume of industrial production as a whole and the volume of retail selling were so great and so well maintained as to cause business to prosper in the main, in spite of these downward price trends. The high level of consumption that accounted for the volume of sales was attributed to an exceptionally high wage level that was broadly disseminated. Geographically speaking, employment was most general in the Middle Atlantic, East Central and a portion of the Pacific Coast region. In the industrial areas of New England, in Florida, in the Southern cotton region and in the agricultural Northwest, special conditions rendered the state of employment less satisfactory. The New England textile industry found continued difficulty in meeting the competition of other areas provided with cheap power, freights and labor

markets; but, as the year closed, the decline in raw cotton stimulated cotton textile activity in New England. Continuing insufficiency of farm revenues, prolonged by a mediocre spring wheat crop, worked as a handicap in the Northwest. In Florida a halting of the rapid previous development of home building, of resorts, of agricultural lands and of town sites, led to hesitation and to some interruption of development. The embarrassment of a record cotton crop of more than 18,000,000 bales caused a drop in the price of the staple so great—by comparison with the price for the crop of 1925—as to occasion a considerable falling off in the total sale value, at going prices of the 1926 crop, as compared with that of its smaller predecessor. At the same time a considerable total of Southern credit that would otherwise have been available for other uses was diverted to the purpose of financing crop storage.

Conspicuously prosperous were a number of the so-called "key industries." The termination of the anthracite strike in Pennsylvania early in the year was followed by resumed production on a heavy scale and at profitable prices. The automobile industry, though some doubt had been felt that it could continue at the rate set in 1925, none the less made remarkable strides, both in production and in the marketing of its product, throughout the greater part of the year. The steel industry, from a good start, became increasingly active in July and succeeding months, well into the autumn. The suspension of the British coal output by reason of a nation-wide coal strike created an export demand for the coal of the bituminous mines of the Eastern bituminous coal mining States, and there resulted a period of exceptional production of bituminous coal, accompanied by high prices, which lasted till the termination of the British strike at the end of November.

The building trade, after a long period of activity, showed evidences, as the year drew to a close, of having about caught up with demand, in many respects. The failure of an important firm of real estate mortgage bond bankers, G. L. Miller and Co., in September, drew attention to the view of critics that the business of marketing and administering mortgage-bond investments required in some instances a more conservative handling. This tended to slacken somewhat the pace of enterprises in the building field. The situation of the markets for lumber and for some other products used in construction was affected.

The mail-order, chain-store and ten-cent store enterprises, among the more recent commercial developments, continued to prosper. The habit of hand-to-mouth buying on the part of merchants persisted as a conspicuous element of the mercantile situation. The likewise recent development of installment selling at retail continued to expand, and was the subject of much and diverse comment. Railroads carried in most cases an exceptionally great amount of traffic, the volume of their revenue making up for increased labor costs, and rendering their year in most cases a prosperous one. Money was lent at moderate rates throughout the year. Investment demand absorbed an unusually large total of new securities, and, in particular, new investment in foreign securities was estimated to have aggregated in the course of the year about \$1,900,000,000. See FINANCIAL REVIEW; RAILWAYS.

**FOREIGN TRADE.** The calendar year 1926 was the fourth year of consecutive increase in the country's total foreign trade, and likewise in its merchandise imports, as measured by value. The exports scored a slight decline, as measured by the same means, falling about 2 per cent below those of the year previous. This decline resulted in the main from a fall in the export price of raw cotton. According to a computation made in the Department of Commerce, had the quantity of cotton shipped out of the country in 1926 fetched the same average price as the cotton exportations of 1925, the country's export value total for 1926 would have exceeded that for 1925 by about 4 per cent.

Merchandise export value total was, in 1926, approximately \$4,808,000,000, according to the Department of Commerce; in 1925, \$4,910,000,000. Imports of merchandise in 1926 attained in round numbers to a total of \$4,431,000,000; in 1925, \$4,227,000,000. The excess of merchandise exports over merchandise imports diminished noticeably for 1926, as compared with the year previous, being, for 1926, \$378,000,000; for 1925, it was \$683,000,000. The decline was yet more conspicuous as compared with the calendar year 1924, when the export excess attained \$981,000,000. While increases of quantity prevailed in most kinds of merchandise exported in 1926, as against corresponding quantities for 1925, export prices were reported as having decreased about 8 per cent, on the average.

respective proportions of the annual import totals, was not maintained in 1926. On the contrary, the ratio of crude materials fell off slightly, in part as a result of lower prices for silk and wool.

Among the articles of export, coal achieved the largest individual increase among the larger items. The activity in coal exportation in 1926 was occasioned by the prolonged coal strike in England, which brought to America a demand, both from Latin America and from European points, for quantities of coal normally supplied by the British mines.

**Distribution of Export Trade.** Data on the exports of different regions for 1925 placed New York State in the lead, with shipments to foreign countries of goods valued at \$810,416,054. Texas, previously leader in this respect on account of large oil shipments, exported goods to a value of \$758,665,052; foreign shipments from Pennsylvania were in total value \$302,869,783; those from Louisiana, \$265,891,941; from California, \$248,235,719; from Michigan, \$247,210,727.

**SHIPPING.** For statistics and other information in respect to the shipping of the United States during the year, see articles SHIPPING and SHIPBUILDING.

**MANUFACTURES.** All the leading manufacturing industries are discussed under separate articles, such as AUTOMOBILES; BOOTS AND SHOES; IRON AND STEEL; PAPER; RUBBER; SILK; TEX-

\* Average for fiscal years.

The decline in the value total of crude materials and of manufactured foodstuffs was the chief element in the decline of the total for all merchandise exported; the decline in the case of crude materials was 11 per cent of their value total for the year previous. The decline in the manufactured foodstuff export value total was 12 per cent; this decline was laid to smaller shipments of refined sugar and to diminished exportation of packing-house products. The group of goods classed as semi-manufactured made a small decline in export value total. Finished manufactures, on the other hand, exceeded the export total of the year previous by about 6 per cent.

Imports increased in value, as compared with those for 1925, in all the economic classes of merchandise except that of manufactured foodstuffs. Finished manufactures were imported to a value greater by 10 per cent; crude foodstuffs, by 9 per cent, the latter increase being largely due to the item of coffee. A low price for sugar was the controlling factor in a decline of 16 per cent in the total value of imported manufactured foodstuffs. The previously established tendency of manufactures to decline and of crude materials to advance, in their

ROMAN CATHOLIC CHURCH, PROTESTANT EPISCOPAL CHURCH, etc.

OUTLYING POSSESSIONS. For the outlying possessions of the United States, see the following articles: ALASKA, GUAM, HAWAII, PHILIPPINES, PORTO RICO, etc. For other countries with which the United States government has been in close administrative relation, see CUBA, DOMINICAN REPUBLIC, and HAITI.

FINANCE. Based on what Secretary of the Treasury Mellon in his annual report to Congress, presented December 9, called a level of national income not before exceeded, the revenue of the United States Government derived from incomes and profits made in 1925 ran above calculations in 1926. Prosperity in 1926 in turn indicated a continuation of large yields to the Government from income taxes in the ensuing year, and rendered simpler the problem of meeting the Government's coming financial requirements. The proposal to diminish the income-tax payments, by either a rebate on payments made in 1926 or a revision of the tax-rate schedules to apply in 1927, was discussed in Congress and by the administration, but not adopted in the form of enactment up to the close of the year. See TAXATION.

*Foreign Debt Funding.* The funding of inter-governmental debts owed to the United States made progress in 1926 through the conclusion of agreements to fund the debt of France, April 29, and that of Jugo-Slavia, May 3. Both these agreements were later approved by the House but not by the Senate. The debt settlement with Italy, negotiated in 1925, was ratified by enactment of April 28; those with Belgium, Estonia, Latvia, and Rumania by acts of April 30; that with Czecho-Slovakia by act of May 3. Senate action on the French debt agreement, involving the largest amount after the British, awaited prior action by the French Parliament which was not taken during the year. The terms of the French debt agreement called for the issue of \$4,025,000,000 of bonds of France, dated June 15, 1925, to the United States. Their total was to represent the principal and accrued unpaid interest to that date. These bonds were to be redeemed in yearly serial payments of principal extending through 62 years; the yearly payments, starting with \$30,000,000 in 1926, to rise to an ultimate \$117,000,000, approximately, in the next-to-last year. Interest was to start accruing June 15, 1930, at the rate of

1 per cent per annum; the rate rising gradually till it attained 3½ per cent in 1965.

Debt funding agreements negotiated by the World War Foreign Debt Commission with the several debtor nations, up to the end of 1926, are presented in the accompanying table.

Country	Original principal (net)	Funded interest	Funded debt
	\$	\$	\$
Belgium	377,029,570	40,750,429	417,780,000
Czecho-Slovakia	91,879,671	23,120,328	115,000,000
Estonia	12,066,222	1,763,777	13,830,000
Finland	8,281,926	718,073	9,000,000
France	3,340,516,043	684,483,956	4,025,000,000
Great Britain	4,074,818,358	525,181,641	4,600,000,000
Hungary	1,685,835	253,164	1,939,000
Italy	1,647,869,197	394,130,802	2,042,000,000
Latvia	5,132,287	642,712	5,775,000
Lithuania	4,981,628	1,048,371	6,030,000
Poland	159,666,972	18,993,027	178,560,000
Rumania	36,128,494	8,461,505	44,590,000
Jugo-Slavia	51,037,886	11,812,113	62,850,000
Total	9,811,094,094	1,711,259,905	11,522,354,000
(Cents omitted)			

Payments of principal on the funded obligations of debtor governments, to November 15, from the outset of such payments, are subjoined, as to totals.

Belgium	\$2,100,000
Czecho-Slovakia	3,000,000
Finland	137,000
Great Britain	70,000,000
Hungary	19,690
Italy	5,000,000
Lithuania	60,225
Rumania	200,000
Jugo-Slavia	200,000
Total	80,716,915
(Cents omitted)	

Payments of interest under the funding agreements, by debtor governments, up to November 15, had attained the following totals:

Belgium	\$1,740,000
Estonia	50,000
Finland	938,895
Great Britain	479,880,000
Hungary	146,800
Latvia	87,000
Lithuania	362,931
Poland	1,750,000
Total	484,955,627
(Cents omitted)	

*Condition of the Treasury.* The United States Treasury showed at the close of the fiscal year, June 30, a favorable balance of \$211,128,078. Gold and currency in the general fund totaled \$249,876,451. Added to this, cash in transit and credit balances to the Treasury's account at divers depositories formed a total of \$501,620,080. Current liabilities stood at \$290,492,002. The Treasury surplus was somewhat less than that of a year earlier, but was up to the most favorable expectations, in view of the reduction of income-tax rates applying to the payments due within the calendar year 1926.

In the fiscal year 1926 the ordinary receipts of the Treasury totaled \$3,962,755,960, as compared with \$3,780,148,684 in the fiscal year 1925. Customs contributed \$579,430,092; income tax, \$1,982,040,088; miscellaneous internal revenue, \$855,599,298; miscellaneous receipts, \$545,686,219.

*Debt.* The Treasury continued in 1926 its policy of debt reduction from surplus available. On March 1, it offered to purchase at 101½ or less, for the account of the cumulative sinking fund, bonds of the Third Liberty Loan 4¼ per cent issue up to a total of \$100,000,000. There were offered at prices not exceeding 101 10/32, \$121,750,000, and this amount was purchased. An important funding operation was also carried out in March. The Treasury issued \$494,898,100 of bonds under the act of 1917, redeemable in 1946 and payable in 1956, bearing interest at 3¾ per cent. This issue served mainly to refund Treasury notes maturing March 15. It was issued at the lowest interest rate obtained on Government bonds since 1917. During the year, the Treasury continued purchasing Third Liberty Loan bonds, the year's purchases to October 31 being reported as aggregating \$207,364,800. It was the purpose of the Treasury to retire as great a portion of this issue as possible prior to its maturity in 1928. There were issued in December \$200,000,000 of 3¼ per cent Treasury certificates, to draw interest from December 15, and to run nine months, the purpose of the issue being to meet a portion of the \$450,000,000 of 3¾ per cent certificates maturing December 15; the remainder of the maturing issue was paid off from Treasury funds.

The debt of the United States on Nov. 30, 1926, totaled \$19,137,364,639, as against \$20,516,193,887 on June 30, 1925. Reduction of the gross debt total in the fiscal year ending June 30, 1926, amounted to \$872,977,573. This was effected mainly by sinking fund retirements, chargeable to ordinary receipts, to the extent of \$487,376,051 and out of surplus to the extent of \$377,767,817.

*Budget.* The President's budget message, transmitted to Congress December 8, forecast a surplus of \$383,079,095 for the Treasury at the close of the fiscal year, June 30, 1927. Opposition to a definitive revision of tax rates at the current session of Congress was expressed in the message, but the proposal of a temporary lightening of income taxes, by means of a refund to take the form of a rebate on ensuing March and June payments, was presented.

Receipts for the fiscal year 1926-27 were reckoned at \$4,026,780,688; expenditures, at \$3,643,701,593. For the fiscal year ending June 30, 1928, receipts were estimated at \$3,772,753,077; expenditures, at \$3,572,049,214; and surplus, at \$200,703,863.

The budget for that year, the President stated, made provision for a military and naval strength of over 610,000 men, and allotted \$574,000,000 to defense. The total budget appropriation for aviation was asserted to be \$82,500,000. Indirect provisions for Prohibition enforcement, combined with direct, were represented as aggregating \$30,000,000. A total of approximately \$765,000,000 for the relief, care and comfort of veterans was recommended. The President expressed his view that commencement of three of the eight light cruisers (authorized in 1924) in the immediate future would be ill timed, in view of pending efforts toward agreement on further curtailment of naval armaments; for this reason the budget included no provision for starting these cruisers. While a provision of \$75,000,000 had been made for aid to States in road building in the fiscal year, the President expressed his belief that Federal road aid should be restricted to interstate highways. See *ROADS AND PAVEMENTS*.

The accompanying table presents the estimates of appropriations in the budget for the fiscal year ending June 30, 1928, and also the appropriations for the fiscal year 1927. The 1928 estimates therein presented omitted amounts needed to carry out the public building act of May 25, 1926, placed at approximately \$20,000,000; likewise appropriations in 1927 and estimates for 1928, for refunding taxes, were omitted.

*ARMY AND NAVY.* The army and navy are treated separately in the articles *MILITARY PROGRESS* and *NAVAL PROGRESS*. See also articles on *AERONAUTICS*, *SHIPBUILDING*, *SHIPPING*, etc.

*VETERANS' BUREAU.* Laws were enacted amplifying the aid provided to World War veterans by the Government, and extending the functions of the Veterans' Bureau. The act of Mar. 30, 1926, appropriated \$8,000,000 for additional hospital and out-patient dispensary facilities, and an additional sum of \$70,000,000 to the adjusted service certificate fund, toward the payment of certificates 20 years from their dates; also \$12,250,000 for military and naval death or disability compensation accrued in the fiscal year or in earlier years; also \$27,000,000 additional for military and naval insurance for the current fiscal year. An act of June 2 extended for one year, to July 2, 1927, the time for converting yearly renewable term insurance, and it vested in the Veterans' Bureau the discretion to extend the time thereafter in cases of mental disability or disappearance of the insured; the five-year level premium term policy was also added by this act to the policies into which the term insurance might be converted. An act of July 2, 1926, provided compensation of not less than \$50 a month for veterans with arrested cases of tuberculosis. It extended rehabilitation training for a year to June 30, 1927. It also added organic loss of speech and spinal meningitis to the list of diseases entitling soldiers or sailors to Government assistance, and made women who had served in base hospitals overseas eligible for the benefits of the World War Veterans' act. An act of July 3, 1926, made several provisions to meet particular difficulties in the filing of applications under the adjusted compensation act, and forbade deductions from adjusted service credits on account of any indebtedness of a veteran to the United States.

## ESTIMATES OF APPROPRIATIONS FOR THE FISCAL YEAR 1928, COMPARED WITH THE APPROPRIATIONS FOR THE FISCAL YEAR 1927

	Estimates of appropriations, 1928	Appropriations, 1927
Legislative establishment .....	\$16,174,988.76	\$17,834,919.57
Executive office .....	438,460.00	819,460.00

Total, including Postoffice Department and Postal Service .....	4,014,571,124.60	3,998,027,396.48

\* Appropriations for the Railroad Labor Board for 1927 were made available for expenses of the Board of Mediation.

**Hospitals.** At the close of the fiscal year the Bureau had in operation 51 hospitals. Of these 18 were for the treatment of tuberculosis, 16 for neuro-psychiatry, and 17 for general medical and surgical service. Use was made, in addition, of the available facilities of 49 other hospitals of the Army, the Navy and the Public Health Service, and of space in civil hospitals in many parts of the country. There was a falling off during the year of admissions to the general and tuberculosis hospitals on account of disease or injuries due to service, rendering possible a greater hospitalization of veterans of all wars subsequent to 1897, for complaints treated by such hospitals and not incurred through service. Among the insane patients there were relatively fewer discharges, and the facilities remained more completely in use for the war cases. The total of all Government beds available June 30, 1926, was 30,564, of which 8373 were unoccupied. Admissions of patients to all hospitals for treatment by the

Veterans' Bureau in the fiscal year numbered 70,795. Of that total pulmonary tuberculosis cases numbered 17,605, neuro-psychiatric 12,677 and general cases 40,513.

**Rehabilitation.** The operations of the fiscal year in regard to training veterans for employment were carried on in the expectation that this service would cease at the close of the year. Courses had on this account to be curtailed so as to come within the expected time limit. The number of those in training fell from 21,803 at the beginning of the fiscal year to none on July 1, 1926. Many whose courses had been curtailed returned into training after July 2.

**Adjusted Compensation.** In the fiscal year, applications for adjusted compensation to the number of 397,008 were received, bringing the total of all such applications under the operation of the system to 3,242,188. Of the 3,145,222 claims adjudicated up to the end of the fiscal year, disposition was made of 2,980,306 by issue

of adjusted service certificates to veterans. Of the remaining claims, 58,596 related to dependents of veterans whose credit exceeded \$50; the rest of the claims were to amounts of \$50 or less. The total amount of adjusted service certificates outstanding at the end of the fiscal year was \$3,069,796,731. Appropriations for the adjusted service certificate fund, to June 30, 1926, totaled \$220,000,000, and disbursements from this fund to that date totaled \$19,961,927, of which \$15,354,526 occurred in the course of the fiscal year. The balance of the fund on June 30 was \$203,915,047.

**POST OFFICE.** The operation of the act of 1925, increasing salaries and compensation of the lower-class postmasters and of postal employees, again produced a deficit in the operations of the Post Office Department. The operating deficit was \$37,906,118 for the fiscal year ending June 30, 1926. As compared with the deficit for the preceding year, it showed a decline of \$1,838,909. According to the Postmaster General, a great part of the 1926 deficit resulted from the discharge of obligations carried over from previous years and from contributions to the civil service retirement fund. As rendered by him, the actual cash deficiency was accordingly only \$19,972,379. He estimated the cost of increased salaries imposed by the act of 1925 as approximating, for the fiscal year 1926, \$65,000,000, of which higher postal rates provided under the same act defrayed not much more than one-half.

With approximate deduction made to offset the effect of the higher postal rates, the business of the postal service on the basis of the old rates was estimated to have made for 1926 an increase of 5.36 per cent over that of the fiscal year preceding. A survey to provide an analysis of the revenues of the service and the cost of handling the mail was made in four representative weeks, one in each quarter of the fiscal year, but the results of this survey were not officially formulated by the close of the calendar year 1926. The revenue of the postal service for the fiscal year, money order fees included, attained a total of \$659,819,801. It exceeded that for the fiscal year ending June 30, 1925, by \$60,228,323, or by 10.04 per cent, the increase resulting largely from the application of the higher rates throughout the later year. Expenditures for 1926 attained \$679,704,053, and exceeded by \$40,422,405 those for the preceding fiscal year. Postage paid on mail amounted to \$587,856,191, and formed 89.09 per cent of the entire revenue. Expenditure for postage was \$4.97 per capita of the population.

The number of post offices of the first, second and third classes increased by 262 to a total of 15,461 at the close of the fiscal year, from 15,199 at its outset. Post offices of the first and second classes had 122,159 employees at the close of the fiscal year, postmasters, rural carriers and motor-vehicle workers not included. The increase in this number for the year included 2000 clerks and 1987 carriers hired, while 1608 clerks and 448 carriers left the service. The expense of transportation of mail by rail routes for the fiscal year aggregated \$106,656,368, and was less by \$834,732 than that for the previous year.

Progress in development of air-mail service was made in the fiscal year by extension of transcontinental airway lighting from Rock

Springs to Salt Lake City, thus providing 2045 miles of lighted airway, stretching from New York to Salt Lake City. The work formed part of a plan to light the entire 2669 miles of airway between New York and San Francisco. The air mail (Government-owned) carried in the course of the fiscal year 353,641 pounds of mail at the rates established for its service, and received therefor a total of \$861,865 excess postage, this total being \$259,237 higher than in the year preceding. The transcontinental route made \$700,894 of this total, and the New York-Chicago route the remainder. Apart from the Government-owned air mail there were put in operation in the fiscal year nine contract air-mail routes served by private aircraft. These ran from Chicago to St. Louis, Chicago to Dallas, Chicago to Minneapolis, Chicago to Detroit, Detroit to Cleveland, Salt Lake City to Los Angeles, Elko, Nev., to Pasco, Wash., Jacksonville to Miami, and Cheyenne to Pueblo, Colo. The first of these routes commenced operation Feb. 15, 1926. All the contract routes covered, among them, 378,478 flight miles up to the close of the fiscal year. The appropriation for contract air-mail service for the fiscal year was \$500,000, of which only \$101,588 was expended. See AERONAUTICS.

There were in operation, June 30, 1926, 45,318 rural delivery routes serving some 6,610,000 families. Their service involved an aggregate of 1,232,175 miles of travel each day. It was defrayed by an appropriation of \$88,350,000 and by part of a supplemental appropriation of \$20,977,402 for equipment maintenance in two fiscal years. The entire postal service distributed, of first-class mail, 9,451,599,623 pieces; of mail of other classes, 8,377,081,831 pieces. These totals represented an increase of 0.81 per cent in first-class mail and a decrease of 0.06 in mail of other classes, as compared with the year previous. Mail dispatched to foreign destinations during the year aggregated a weight of 60,045,484 pounds, chiefly composed of prints and of parcel-post packages. Of mail to foreign destinations 470,015,199 pieces were dispatched, according to estimate, parcel post not included, and 369,041,616 were received.

With regard to the dispute over the postal rate schedule, it was asserted that the two-cent rate on private mailing cards had resulted in the general disuse of this type of postal service. Accordingly, the House of Representatives passed on December 20 a measure to restore the one-cent rate on such cards. Bearing on the demand of newspaper and periodical publishers for a reduction in the rates on second-class matter, the figures on mailings of such matter for the fiscal year showed the total to aggregate 1,493,235,888 pounds, and to represent an increase of 75,744,315 pounds over the total for the year preceding. Postage collected on these mailings amounted to \$31,983,209, of which postage on the advertising matter at the special rates provided therefor furnished \$19,286,364. At the close of the year 29,141 publications held a second-class status, this being an increase of 616 for the year.

A series of robberies of vehicles carrying mails led to an order, October 20, disposing of 2500 men of the Marine Corps as armed guards for these vehicles in 23 cities.

The postal savings system had, on June 30, \$138,033,326 to the credit of its depositors. This

total represented an increase of \$2,102,428 for the year. The items composing it were: Outstanding postal saving certificates, \$134,178.558; accrued interest, \$3,796,141; postal savings stamps, \$58,628. The depositories for postal savings numbered 5853, a decrease of 32 in the course of the year. In the year, postal savings certificates to a total of \$544,160, or \$213,020 more than in the year previous, were exchanged by holders into 2½ per cent postal savings bonds.

**PENSIONS.** The Bureau of Pensions disbursed in the fiscal year ending June 30, 1926, for pensions, a total of \$207,844,348, representing the entire amount appropriated and available for this use. It received and classified 138,253 pension claims. Of these 42,894 were based on Civil War service and 72,437 on service in the war with Spain. It disposed of 139,351 claims, and issued pension certificates to the number of 87,956.

A reduction of \$9,306,364 in pensions paid to veterans and widows of different wars occurred during the year. The net loss to the pension roll for the fiscal year was 10,814. The roll of the Civil War soldier pensioners was reduced by 19,776; that of Civil War widow pensioners by 14,543. These reductions were largely offset by a gain of 20,480 to the Spanish War soldier roll, and 2448 to the Spanish War widow roll. Of the pensioners on the rolls at the end of the fiscal year, 106,790 were Civil War veterans, 226,650 Civil War widows, 122,182 Spanish War veterans, and 20,811 Spanish War widows. There were still on the rolls, 9 soldiers of the war with Mexico, and 20 widows whose husbands served in the War of 1812. The total distribution to pensioners under the pension system since 1790 has been \$7,261,346,359, of which \$6,784,920,604 was paid on account of the Civil War and \$181,995,079 on account of the war with Spain. The Revolutionary War cost approximately \$70,000,000 in pensions, the War of 1812, \$46,162,715; the war with Mexico, \$57,487,054; and Indian Wars, \$20,500,128. The average annual value of pensions of all classes was given as \$414.26; the average annual value of pensions to soldiers of the Civil War, \$802.64; to soldiers of the war with Spain, \$197.96; to widows of the Civil War, \$378.86; and to widows of the war with Spain, \$287.83.

Under the classified civil service retirement fund the Pension Bureau reported 17,037 civil service employees placed on the annuitants' roll and 4513 names dropped by reason of death or other cause, leaving 12,524 annuitants on the roll on June 30, 1926. The number of new claims in the year was 38,972, and number of claims disposed of, 37,457. The civil service retirement and disability fund, amounted, June 30, 1925, to \$44,665,778. During the year the fund was increased through deductions from salaries, and by interest, profits, and miscellaneous receipts, by a total of \$20,166,233. Total disbursements from the fund were \$10,210,465, leaving a surplus in the fund on June 30, 1926, of \$54,622,546.

**DIPLOMATIC SERVICE.** The year passed with relatively few changes in the diplomatic personnel abroad. The chief of these was the succession of Ogden H. Hammond to the post of ambassador extraordinary and plenipotentiary at Madrid. Mr. Hammond arrived at Madrid March 24, and was presented to King Alfonso March 27. Owing to the non-ratification of the

treaty with Turkey, the post of ambassador to that Government remained vacant throughout the year.

Alanson B. Houghton, summoned home from his post in Great Britain for conference in Washington, presented in March an unfavorable view of European prospects, which aroused discussion in the Senate. He returned to his post in April.

Senator Henry Bérenger, appointed French ambassador to the United States, left Paris for Washington January 6. He had for his especial mission the negotiation of an agreement for the funding of the war debt of the French Government to the United States. This mission performed, he returned to France. Count Paul Claudel was named ambassador of the French Republic to the United States, November 30, succeeding M. Bérenger.

Allen W. Dulles, after serving as United States delegate to the preliminary armament conference, resigned from the foreign service, the low remuneration being alleged as the cause of his action. Charles Vincent Massey was appointed, December 5, envoy extraordinary and minister plenipotentiary from Canada to the United States, being the first regular diplomatic representative of the Dominion in the United States.

The following lists give the names of the diplomatic representatives from the United States to foreign countries, and from foreign countries to the United States, in 1926:

#### EMBASSIES AND LEGATIONS OF THE UNITED STATES:

Albania—Charles C. Hart, minister.  
 Argentina—Peter Augustus Jay, ambassador.  
 Austria—Albert Henry Washburn, minister.  
 Belgium—William Phillips, ambassador.  
 Bolivia—Jesse S. Cottrell, minister.  
 Brazil—Edwin V. Morgan, ambassador.  
 Bulgaria—Charles S. Wilson, minister.  
 Chile—William Miller Collier, ambassador.  
 China—John Van A. MacMurray, minister.  
 Colombia—Samuel H. Piles, minister.  
 Costa Rica—Roy T. Davis, minister.  
 Cuba—Enoch H. Crowder, ambassador.  
 Czecho-Slovakia—Lewis Einstein, minister.  
 Denmark—H. Percival Dodge, minister.  
 Dominican Republic—Evan E. Young, minister.  
 Ecuador—Gerhard A. Bading, minister.  
 Egypt—J. Morton Howell, minister.  
 Esthonia—Frederick W. B. Coleman, minister. (Also to Latvia and Lithuania.)  
 Finland—Alfred J. Pearson, minister.  
 France—Myron T. Herrick, ambassador.  
 Germany—Jacob Gould Schurman, ambassador.  
 Great Britain—Alanson B. Houghton, ambassador.  
 Greece—Robert P. Skinner, minister.  
 Guatemala—Arthur H. Geissler, minister.  
 Haiti—\_\_\_\_\_, minister.  
 Honduras—George T. Summerlin, minister.  
 Hungary—Theodore Brentano, minister.  
 Italy—Henry P. Fletcher, ambassador.  
 Japan—Charles MacVeagh, ambassador.  
 Latvia—Frederick W. B. Coleman, minister. (Also to Esthonia and Lithuania.)  
 Liberia—\_\_\_\_\_, minister resident and consul-general.  
 Lithuania—Frederick W. B. Coleman, minister. (Also to Esthonia and Latvia.)  
 Luxembourg—William Phillips, minister.  
 Mexico—James R. Sheffield, ambassador.  
 Morocco—Maxwell Blake, diplomatic agent.  
 The Netherlands—Richard M. Tobin, minister.  
 Nicaragua—Charles O. Eberhardt, minister.  
 Norway—Laurita S. Swenson, minister.  
 Panama—John Glover South, minister.  
 Paraguay—George L. Kreeck, minister.  
 Persia—Hoffman Philip, minister.  
 Peru—Miles Poindexter, ambassador.  
 Poland—John B. Stetson, Jr., minister.  
 Portugal—Fred Morris Dearing, minister.  
 Rumania—William S. Culbertson, minister.  
 Salvador—Jefferson Caffery, minister.

Serbs, Croats, and Slovenes, Kingdom of—John Dzyneley Prince, minister.  
 Siam—William W. Russell, minister.  
 Spain—Ogden H. Hammond, ambassador.  
 Sweden—Robert Woods Bliss, minister.  
 Switzerland—Hugh S. Gibson, minister.  
 Turkey ———, ambassador.  
 Uruguay—U. Grant-Smith, minister.  
 Venezuela—Willis C. Cook, minister.

#### EMBASSIES AND LEGATIONS TO THE UNITED STATES:

Albania—Faik Konitza, minister.  
 Argentina—Honorio Pueyrredon, ambassador.  
 Austria—Edgar L. O. Prochnik, minister.  
 Belgium—Baron de Cartier de Marchienne, ambassador.  
 Bolivia—Dr. Don Ricardo Jaimes Freyre, minister.  
 Brazil—S. Gurgel de Amaral, ambassador.  
 Bulgaria—Simeon Radoff, minister.  
 Chile—Don Miguel Cruchaga Tocornal, ambassador.  
 China—Sao-Ke Alfred Sse, minister.  
 Colombia—Dr. Enrique Olaya, minister.  
 Costa Rica—Don J. Rafael Oreamuno, minister.  
 Cuba—Dr. Orestes Ferrara, ambassador.  
 Czechoslovakia—Zdenek Fierlinger, minister.  
 Denmark—Constantin Brun, minister.  
 Dominican Republic—Angel Morales, minister.  
 Ecuador—Don Juan Barberis, first secretary and chargé d'affaires ad interim.  
 Egypt—Mahmoud Samy Pasha, minister.  
 Estonia—Antonius Piip, minister.  
 Finland—Axel Leonard Astrom, minister.  
 France—Paul Claudel, ambassador.  
 Germany—Dr. Hans Heinrich Dieckhoff, counselor of embassy.  
 Great Britain—Sir Esme Howard, ambassador.  
 Greece—Charalambos Simopoulos, minister.  
 Guatemala—Don Francisco Sánchez Latour, minister.  
 Haiti—Hannibal Price, minister.  
 Honduras—Luis Bográn, minister.  
 Hungary—Count László Széchenyi, minister.  
 Irish Free State—Timothy A. Smiddy, minister.  
 Italy—Nobile Giacomo de Martino, ambassador.  
 Japan—Tsuneo Matsudaira, ambassador.  
 Latvia—Charles L. Seya, minister.  
 Lithuania—Karys Bizauskas, minister.  
 Luxembourg—Baron Raymond de Waha, chargé d'affaires.  
 Mexico—Don Manuel C. Tellez, minister.  
 Netherlands—Jonkheer Dr. H. Van Asch Van Wyck, counselor of legation and chargé d'affaires ad interim.  
 Nicaragua—Dr. Don Salvador Castrillo, minister.  
 Norway—H. H. Bryn, minister.  
 Panama—Dr. Don Ricardo J. Alfaro, minister.  
 Paraguay—Dr. Don Eusebio Ayala, minister.  
 Persia—Farhollah Khan Noury Esfandiary, chargé d'affaires ad interim.  
 Peru—Dr. Hernan Velarde, ambassador.  
 Poland—Jan Ciechanowski, minister.  
 Portugal—Viscount d'Alto, minister.  
 Rumania—Radu T. Djuvara, chargé d'affaires.  
 Russia—Serge Ughet, financial attaché.  
 Salvador—Dr. Don Hector David Castro, secretary of legation and chargé d'affaires ad interim.  
 Serbs, Croats, and Slovenes—Dr. Ante Tresich Pavichich, minister.  
 Siam—Phya Vajitavonga, minister.  
 Spain—Don Alejandro Padilla y Bell, ambassador.  
 Sweden—W. Boström, minister.  
 Switzerland—Marc Peter, minister.  
 Uruguay—Dr. Jacobo Varela, minister.  
 Venezuela—Dr. Don Carlos F. Grisanti, minister.

**PATENTS.** During 1925 there were granted, for mechanical inventions, 45,218 patents. Re-issue patents numbered 237, and design patents 2692. The number of trademarks registered was 14,542; of labels, 1400; and of prints, 615. Copies of patents to the number of 2,782,453 were sold, and copies numbering 1,173,752 were sent to foreign countries. The total number of patents issued in the United States from the outset up to the close of 1925 was 1,577,996.

**CABINET.** See under *Administration*.

**SIXTY-NINTH CONGRESS, FIRST SESSION.** Congress reassembled January 4, after the holiday recess. Session activities previous to 1926 were detailed in the preceding *YEAR BOOK*. The session closed July 2. The Senate adjourned until November 2, then to reassemble as an impeach-

ment court for the trial of the case of Judge George W. English.

The chief achievements of the session were: Passage of the Revenue Act of 1926, carrying material reductions in personal income tax, both in the higher and in the normal income groups; enactment of the Watson-Parker measure abolishing the Railroad Labor Board and creating in its place, for dealing with labor matters, a Board of Mediation composed of five members, to effect arbitration of disputes; passage of a measure to encourage commercial aviation, and creation of bureaus in the departments of War, Navy and Commerce, headed by Assistant Secretaries, to deal with aviation matters; creation of a coöperative marketing division in the Department of Agriculture, to advance marketing of agricultural products; increase of annuities under the civil service retirement system; passage of a measure for codification of the Federal statutes since 1789; enactments in favor of veterans of divers wars, and notably of amendments to the World War veteran and adjusted compensation acts (see section on *Veterans' Bureau*, above); ratification of debt agreements with Italy, Belgium and several other governments indebted to the United States Treasury (see under *Finance*, above); ratification, with reservations, of adherence to the World Court.

**Composition of Congress.** The Senate voted, January 12, by a close vote of 41 to 39, to seat Gerald P. Nye, an interim appointee of the Governor of North Dakota, as Senator from that State. Senator Brookhart of Iowa was unseated by a Senate vote of April 12, accepting a decision of the Senate Committee on Privileges and Elections, which after a recount of votes reported Daniel F. Steck, Democrat, rightfully elected, by 1420 plurality, in the Iowa Senatorial election of 1924. Senator-elect Thomas D. Schall (Rep., Minn.) was seated by the Senate, the contest of his election in 1924, brought by the defeated candidate, Magnus Johnson, being dismissed.

**Tax Legislation.** While both houses proceeded with measures to reduce taxation in consonance with the excess of revenue over expenditure attained in the previous fiscal year, the bills prepared by the Senate Finance Committee and the House Committee on Ways and Means differed greatly. The bill reported out of committee in the Senate, January 20, provided for the cessation of the tax on estates of decedents dying after the going into force of the measure. It also called for large reductions in the income tax, reckoned to aggregate about \$46,000,000 in normal tax, \$121,000,000 in surtaxes, and \$42,000,000 in personal exemptions. The House bill maintained the estate tax, while raising to 80 per cent the allowances from it for State estate taxes. It provided less considerable reductions of income tax than did the Senate bill, in the aggregate. The tax on automobiles was reduced in the House bill.

The Senate voted, February 10, to repeal the estate tax and the taxes on theatre tickets and automobiles, thus adding reductions expected to total over \$100,000,000 to the reductions of taxes provided in the House revenue measure. As finally passed by the Senate, February 12, the bill carried reductions estimated at \$456,261,000. The Senate voted, February 2, for increase of the corporation tax to 13½ per cent,

FOUR UNITED STATES SENATORS PROMINENT IN 1926

100

from 12½, of income, and for repeal of the tax on capital stock. The reduced surtax rates on incomes, recommended by the finance committee, providing surtaxes up to 20 per cent on \$100,000 income, half the existing maximum, were voted by the Senate on the following day. The Norris amendment to make all income tax returns public was defeated February 8.

A conference committee proceeded to reconcile the two bills. The measure that it produced, February 20, maintained the estate tax; reduced the capital tax; abolished the gift tax and a considerable list of miscellaneous taxes such as those on cameras, firearms and jewelry; maintained a tax on theatre admittances; removed that on auto trucks; maintained a tax on other automobiles; and allowed various reductions of income tax totaling an estimated \$164,400,000 a year. The bill, as presented by the conference committee, was passed by the House February 23, and by the Senate on the day following. The President signed it February 26.

*Foreign Debt Settlements.* The House ratified the Italian debt settlement January 15. On the following day it ratified the settlements with Belgium, Czecho-Slovakia, Rumania, Esthonia, and Latvia. Presented by President Coolidge, who endorsed it as a settlement "fair and honorable to both governments," the agreement negotiated by Ambassador Béranger and the debt funding commission for the repayment of the French debt to the United States Government was attacked in the Senate April 30 by Reed (Democrat, Mo.), Borah (Republican, Idaho), Harrison (Democrat, Miss.) and McKellar (Democrat, Tenn.). The House approved the French war debt settlement, June 2, and sent it to the Senate, which, however, did not act upon it in the course of the year.

*Settlement of Railroad Labor Disputes.* The Senate passed, May 11, a measure for the abolition of the Railroad Labor Board, which it had received from the House. The bill, favored by railroad executives and labor organizations alike, left the settlement of labor disputes to the parties involved, in the first instance, but provided a board of mediation to intervene at the request of either party, and if necessary to postpone strikes. The President signed the measure May 20.

*Discussion of Armaments Indorsed.* Congress, January 4, received from President Coolidge a special message recommending that \$50,000 be appropriated to cover the expense of participation in the preliminary League disarmament conference. The House voted this sum January 18. The Senate passed the appropriation January 20.

*Appropriations.* The House adopted, April 12, a naval aviation bill with a programme calling for expenditure of \$85,000,000 over a term of five years. The Senate passed, June 3, the naval aviation programme. The five-year army aviation building programme, to cost some \$150,000,000, was approved, May 5, by unanimous vote of the House. The House, January 25, passed the naval appropriation bill. This bill, as it passed the Senate, February 16, carried a total of \$321,495,940, and thus exceeded the House bill, which disposed of only \$312,312,297. A deficiency bill to provide additional men and vessels to enable the Coast Guard service to increase its efforts to suppress illicit entry of

alcoholic beverages was reported in the House February 1. An appropriation of \$9,000,000 to provide new Coast Guard vessels to be employed in Prohibition enforcement was passed by the House May 17. The Treasury and Post Office appropriation bill, carrying \$868,515,581, passed the Senate February 15, and went to a conference committee for adjustment of the differences between the measures of the two houses. The Porter bill, carrying \$10,000,000 for embassy buildings abroad, passed the House March 15. The Rivers and Harbors bill was passed by the House June 4. As it left the House it provided for a 400-mile canalization along the Missouri River, a diversion of the Illinois River, and the purchase of the Cape Cod Canal. The Federal Public Buildings bill was altered in conference committee, and, as thus altered, carried \$165,000,000 appropriations. Of this total \$50,000,000 was for construction in the District of Columbia, \$100,000,000 for new Federal construction in various parts of the country and \$15,000,000 for completion of buildings authorized in 1913. The bill in this form passed the Senate May 17. The bill increasing pensions on account of Spanish War service was passed by the House April 5. The Spanish War pension bill, signed by the President May 1, provided approximately \$19,000,000 and increased allowances to injured, aged and widowed recipients. The World War veterans' act, as passed by the Senate, June 28, provided hospitalization for women and extensive reorganization of the existing system of providing for veterans. A conference committee of the two houses took their respective bills into consideration, and the bill was enacted thereafter. The House had previously passed unanimously, May 17, the Johnson bill, carrying appropriations of \$30,000,000 to be used over three years for the relief of disabled veterans.

*Action on the World Court Protocol.* Senator Reed of Missouri, an opponent of the World Court, offered a resolution to investigate propaganda on behalf of adherence by the United States to the court. This was defeated January 6. Applying the closure rule for the second time since 1917, the Senate ended debate, January 25, on the World Court, and on January 27, by a vote of 76 to 17, approved adherence to the court protocol, with reservations as to the amenability of the United States.

The World Court resolution, as passed by the Senate, January 27, gave the consent of the Senate to the United States' adherence to the protocol establishing the Permanent Court of International Justice, as proposed in the President's message of Dec. 9, 1925, but without agreeing to the optional clause for the court's compulsory jurisdiction; and it affixed five reservations as conditions to such adherence. These reservations provided that the United States should not through adherence assume any legal relation to the League of Nations; that it should have an equal voice in the election of judges of the court; that its share in the court's expenses should be determined and appropriated by Congress; that it might withdraw at will; and finally, that the court should render no advisory opinion as to the United States save with the latter's consent. See WORLD COURT.

*Senate Investigation of Primary Campaign Expenditures.* The Senate passed a resolution, May 19, creating a committee of five to investi-

gate expenditures in the Senatorial primary campaigns. Vice President Dawes named Reed of Pennsylvania, Deneen of Illinois, LaFollette of Wisconsin, Republicans; and Reed of Missouri and Bayard of Delaware, Democrats. Reed of Pennsylvania, Bayard and Deneen declined, and were replaced by McNary of Oregon and Goff of West Virginia, Republicans, and King of Utah, Democrat. Reed of Missouri was made chairman.

The Reed committee held hearings in Pennsylvania in June and elicited testimony that \$2,793,583 had been spent there. On July 26 it took up the investigation of the Illinois Senate primary campaigns, holding hearings at Chicago. The Reed committee, while in Pennsylvania, June 17, drew from Wayne B. Wheeler, general counsel of the Anti-Saloon League, testimony as to the League's participation in Senatorial campaigns and in Prohibition prosecutions. It appeared from Wheeler's testimony that approximately \$11,000,000 had been collected for all activities, in six years, by the national League and 23 State branches. Mr. Wheeler subsequently testified that the League had spent in 30 years some \$35,000,000, and of this, \$3,430,285 in the years 1920-1925, inclusive.

The committee in its investigations in Illinois summoned before it as a witness Samuel Insull, a public utility capitalist of Chicago, the reputed donor of a large sum for the primary campaign of the Republican Senatorial nominee, Frank L. Smith. Robert E. Crowe, State attorney for Cook County, was also summoned. Both men on the witness stand refused to answer questions put by Senator Reed with regard to contributions. The Reed committee in a partial report, published December 22, dismissed charges of Senate primary campaign abuses in Oregon, Missouri, and Washington. The investigation of the Pennsylvania charges was reported as not yet completed at the end of the year.

*Other Senate Investigations.* The report of the Couzens committee, the Senate committee investigating the conduct of the Bureau of Internal Revenue, was submitted January 12. It impugned the propriety of amortizations allowed taxpayers, subsequently to 1921, to a total of \$210,000,000, and of tax refunds between July 1, 1921, and April 30, 1925, to the total of \$460,000,000.

As a consequence of an attack previously made on the Aluminum Company of America, reputed to be under the financial control of Secretary of the Treasury Mellon and his brother, resolutions were introduced, January 5, in both houses, for the investigation of the company. A Senate resolution to investigate failure of the Department of Justice to prosecute the company was passed January 6. Attorney General Sargent, appearing before the Senate committee on judiciary, January 8 expressed doubt as to how the Department of Justice could obtain and employ against the Aluminum Company confidential information said to be in the hands of the Federal Trade Commission. A report of the judiciary committee, unfavorable to Secretary Mellon and the Department of Justice, and submitted by Walsh of Montana (Democrat), dealt with the Aluminum Company of America. The Senate rejected it, February 26.

An investigation of the Tariff Commission was decreed by a Senate resolution passed March 11. Robinson of Arkansas (Democrat), of the investigating committee, subpoenaed the

Tariff Commission, March 30, to compel it to furnish reports made to the President on sugar, butter, linseed oil, and certain other tariffs.

The Senate voted, July 1, for an investigation by the judiciary committee of the proceedings of the Federal Trade Commission and of the Attorney General in the bread trust cases.

The House committee on interstate and foreign commerce submitted, March 13, a report on the rubber supply, asserting that a British monopoly existed, but offering no recommendations.

A Senate committee named for the purpose, May 27, by the judiciary committee, and consisting of Cummins, Goff and Borah, Republicans, and King and Walsh, Democrats, conducted an inquiry into the constitutionality of the executive order for simultaneous service of local officers under the State and Federal systems for Prohibition enforcement.

*The Woodlock Appointment.* The appointment of Thomas F. Woodlock, as a member of the Interstate Commerce Commission, long a subject of difference between the executive and the Senate, was finally confirmed by Senate vote, March 26. Advocates of sectional representation on the commission, in particular, had opposed the appointment.

*Impeachment of Judge English.* Judge George W. English, of the Federal district of Eastern Illinois, was impeached by the House, on a vote of 306 to 62, April 1. The charges against Judge English included the deposit of funds and assets under court control, in institutions in which the Judge had an interest as stockholder. On the arrival of the time set for his impeachment trial by the Senate, Judge English resigned from the bench of the Federal district of Eastern Illinois, November 4, asserting that the impeachment brought against him by the House in the previous session had "impaired his usefulness." See *Second Session*, below.

*Farm Relief Bills.* Difference of opinion between the supporters of the administration and the Congress group most actively identified with the distressed portions of the farming class resulted in the inability of the Republican majority to harmonize conflicting bills for farm relief. The cooperative marketing measure alone passed, of the farm relief measures offered for passage when the House, May 4, began debate on the subject.

The Haugen bill was defeated in the House May 21, by 212 to 167. The Senate voted against the McNary bill, the Senate equivalent, June 24. The so-called "farm bloc," composed of Senators supporting the agricultural interests, favored the McNary bill, which provided extensive Federal monetary aid to farm organizations, as a revolving fund to aid in the carrying and disposal of surplus crops. After the defeat of this measure they permitted the bill of Senator Fess, endorsed by the administration, and providing a system of Federal farm credits, to come to a vote. The Fess bill was defeated, June 29, by 26 to 54. The Senate on the same day passed the cooperative marketing bill, received from the House. Senators Norbeck, Gooding, Norris, Watson, Cummins, Deneen, Howell, Johnson, McMaster, McNary, and Frazier, 11 in all, had met April 29 and adopted resolutions demanding farm relief legislation before adjournment.

*Amendment of the Constitution.* The Senate voted, February 15, with but two dissenting votes, for the Norris resolution for an amend-

ment of the Constitution to set a date for the inauguration of the President, and to advance the date of the convening of the regular session of Congress; this was designed to do away with sessions held subsequently to the election of Congress but prior to the installation of the new members. The House failed to take action on this resolution, up to the end of the session.

**Reapportionment Bills.** The reapportionment of representation was crowded out by other business in the House, which by vote, April 8, refused to suspend the rules in order to consider reapportionment bills. Snell of New York (Republican), chairman of the House rules committee, declared it as his opinion, April 8, that the reapportionment provision in the Constitution was not mandatory upon Congress, and pronounced against suspending the rules of the House to give consideration to reapportionment bills. The House sustained him, 265 to 87.

Four reapportionment bills were reported to have been rejected by the House census committee prior to the middle of June. At that time Representative McLeod (Republican), of Michigan, a State strongly interested in reapportionment by reason of its growth in population, offered another bill on the subject. His measure proposed to take reapportionment out of the hands of Congress and to place it in those of the Secretary of Commerce, as the administrative head responsible for the census. The Secretary was to be charged with reapportioning representation among the several States in accordance with the returns of each successive census; the total number of Representatives to be 435 until 1931, and thereafter 401. The bill remained undisposed of, at the end of the session.

**Muscle Shoals.** The House voted, 248 to 27, January 5, to create a joint Congressional committee to negotiate leases of the Government power plants at Muscle Shoals. A joint committee on Muscle Shoals was created, and it recommended, April 26, that Government nitrate and power plants at the Shoals be leased for 50 years to a group of Southern power companies. A concurrent resolution to authorize reception of bids for lease of the Muscle Shoals hydro-electric plant passed the Senate March 8.

**Radio Regulation.** A radio regulation bill, designed to correct the situation resulting from the Attorney General's ruling against the legality of the radio licensing system previously operated by the Secretary of Commerce, failed of enactment through non-agreement of the two houses, which passed the measure with differences as to detail, the House vesting authority in the Secretary of Commerce and the Senate placing it in an independent commission. See *Second Session*, below.

**Other Bills.** Legislation to prescribe the conditions under which national banks might establish branches was passed in both houses, but failed, by the end of the session, to come out of conference committee, where it had been placed in order to reconcile differences between the two bills. The House measure, the McFadden Banking bill, linked branch banking with proposed legislation to extend the charter of the Federal Reserve banking system, which consequently also failed of passage.

A bill was introduced by Senator Capper (Republican), to provide in advance of the need a series of measures to put the Government and

the nation on a war basis automatically in case war should occur. Secretary of War Davis, Daniel Willard, Bernard M. Baruch and others spoke, April 9, in favor of the bill, before the Senate Committee on Military Affairs. Secretary of War Davis detailed, April 6, to the House Committee on Military Affairs, a system of laws that he urged be passed in peace time, to go into force in the event of war, and upon proclamation by the President.

A measure, signed by the President May 25, made of an area of some 70,000 acres in Kentucky, comprising the Mammoth Cave, a national park.

The Senate passed a bill to increase the salaries of the Federal judiciary, but on this bill the House failed to take action. See *Second Session*, below.) Provisions for cooperation of Federal and State governments in reclamation development were contained in a bill passed by the Senate; the House failed to take action on it. Walsh (Democrat), of Montana, who had been active in the Senate with regard to the oil lease scandals, brought forward a bill designed to simplify the legal procedure which had resulted in long delay of the trials. The Senate passed this bill May 21. A resolution of Copeland (Democrat, New York), to request the President to intervene in the anthracite strike, was adopted by the Senate, February 9. The Senate having voted for intervention of the Government in anthracite strikes, the House interstate commerce committee, instead of following its lead, voted June 16 to postpone action on coal legislation until the second session. A Senate bill to equalize the railroad rates on long and short hauls was defeated by the Senate, March 24. The vote was 33 to 46, the radical Senators generally voting for the measure.

The House Immigration Committee reported, April 26, its bill revising existing provisions as to the entry and the deportation of aliens. The House measure amplifying the power of the Government to deport aliens was passed, June 7. It permitted deportation of alien criminals for offenses committed up to the period of ten years after their admittance into the country, allowed deportation for second offenses within three years of prison release, and allowed deportation of alien insane without limit as to the length of their previous sojourn.

Secretary of Commerce Hoover presented to the House Committee on Rivers and Harbors, January 29, a plan for the 10,000-mile river and harbor development designed to place the Mississippi Valley States in low-cost water freight communication with the Gulf of Mexico, as a means of providing a cheap export outlet for farm products. The All-American Deeper Waterway project received the support in March of favoring letters, from Secretary of the Navy Wilbur and Captain Elmer C. Crowley of the Emergency Fleet Corporation, addressed to Chairman Dempsey of the House Committee on Rivers and Harbors.

A bill providing for the appointment of 14 additional Federal judges was passed by the House June 8.

**SIXTY-NINTH CONGRESS, SECOND SESSION.** The second session of the 69th Congress convened December 6. At the first opportunity, on the day of convening, Walsh of Montana (Democrat) introduced a resolution in the Senate to investigate the fitness of Arthur R. Gould, Republican

Senator-elect from Maine, to serve the unexpired term of the late Senator Fernald. As no question of the legitimacy of the Maine special Senatorial election had arisen, the issue as to Gould was solely whether or not his alleged relations to corruption of officials in the Province of New Brunswick, in the interest of a railroad project, some years before, rendered him subject to exclusion from the Senate. Advocates of the Walsh resolution maintained that the Senate had full constitutional power to determine the qualifications of its members.

Congress, in joint session, heard the President's message December 7. This was followed December 8 by his budget message, presenting a budget total of \$4,014,571,124 (see the section *Budget*, above), and opposing further tax reduction save in the form of special remissions or returns of taxes in years in which the Treasury surplus should warrant it. Harry B. Hawes, of Missouri, and David I. Walsh, of Massachusetts, both Democrats, were sworn in as Senators on the opening day. Both succeeded Republicans. The death of Senator McKinley of Illinois, December 7, further reduced the Republican Senate contingent.

The impeachment of Federal Judge English, voted by the House in the previous session, was dismissed by the Senate, December 11, since Judge English had resigned between the time of his impeachment and that set for his trial. Frazier of North Dakota (Progressive) was restored to his committee rights, with full seniority, by action of the Senate committee on committees, December 11, after two years of deprivation by reason of his having been excluded from the Republican Senatorial group after the 1924 national election. The House passed, December 9, a measure to increase the salaries of Federal judges; that of the Chief Justice to \$20,500, those of Supreme Court members to \$20,000, circuit court members to \$12,500, and district court members to \$10,000. The measure, previously passed by the Senate, was signed by the President, and was to go into effect Jan. 1, 1927. Garner of Texas offered a measure for permanent further reduction of income taxes, in opposition to the position taken by the President in his message. This measure had considerable support in the Senate among Garner's fellow Democrats, but was tabled, December 11, by the Senate committee on ways and means. The House passed, December 10, the Treasury-Post Office supply bill, carrying \$137,371,000 for the Treasury and \$753,483,000 for the Post Office Department. Opponents of the Prohibition enforcement policy offered amendments to reduce appropriations for the Prohibition services of the Coast Guard, but were defeated. A portion of the bill allowing \$500,000 for payment of so-called under-cover work of Prohibition agents, continuing the practice of the previous year, was eliminated. The House ways and means committee adopted, December 11, a bill embodying recommendations of the President in his message for the return of alien property seized during the War period. McNary of Oregon introduced in the Senate, December 14, a bill presenting, with alterations, his scheme of relief for agriculture. The new bill retained the revolving fund, to be supplied from the Treasury, and the equalization fund to be collected from possessors of designated staples, and added cotton to the list of farm commodities benefiting by the act. Frank L. Smith, Senator-

elect from Illinois for the ensuing term, was appointed by Governor Small of Illinois, December 16, to fill previously the unexpired term of the late Senator McKinley.

**ADMINISTRATION.** *The President.* Mr. Coolidge, in a message to Congress, January 4, advocated acceptance of the invitation of the League of Nations to participate in a preparatory conference on limitation of armaments. With regard to defense aviation plans, he supported the budget appropriations, and the House committee on naval affairs was reported, on March 14, to have assurance of his approval of the measure for a five-year building programme. With regard to legislation for relief of agriculture, the President refrained, until June 25, from any public announcements in favor of one or another of the measures brought forward in Congress. Then he issued a statement indorsing the farm marketing bill of Senator Fess. He was subjected to attack, on this account, by Senators and Representatives identified with farming sections. The Senatorial primary election in Iowa in July was, consequently, considered a test of the attitude of the agricultural element toward the President, and its result, the Republicans' nomination of Brookhart, was deemed an adverse result. The President maintained his previous policy of abstention from interference in the anthracite strike despite efforts in Congress to bring about his intervention. The end of the strike came in February.

Mr. Coolidge sent his annual message to Congress on December 7. Foremost among its recommendations was that for a reduction of the March 15 and June 15 income-tax payments of 1927, to constitute a refund on tax payments previously collected, in excess of Treasury needs. Creation of a Federal board of radio broadcasting control with power to assign radio wave lengths to broadcasting stations, and with administrative collaboration from the Department of Commerce, was advocated. The message proposed to Congress that it create a board of conciliation and mediation, acting under the President, to deal with labor troubles in the coal-mining industry, and that administrative agencies receive power to distribute coal in seasons of shortage. With regard to agriculture, the message advocated extension of the system of cooperative marketing associations, some revision of freight rates, and efforts to provide cheap fertilizers. Continuance of river and harbor improvements on a moderate scale was urged; construction of new merchant ships, save at cost not above prevailing sale prices, was discouraged; enactment of a law to regulate branch banking and provide for renewal of the Federal Reserve Bank charter was urged; a Federal anti-lynching law, rubber development in the Philippines, avoidance of armament competition, an act to enable the Supreme Court to make rules for Federal district courts, and legislation to provide return of alien property, were also recommended. The message strongly stressed the importance of Government economy as a continuing policy. Prohibition was pronounced "the law of the land," and failure to observe and support the law was strongly condemned.

Addressing the annual congress of the Daughters of the American Revolution, the President, April 19, spoke against the failure of many American citizens to exercise the franchise. In a Memorial Day address at the Arlington Na-

tional Cemetery, he praised economical and sound government finance as a form of safeguard in respect to risk of war.

An address that was delivered by President Coolidge on April 8, on the occasion of the laying of the cornerstone of the National Press Club, at Washington, presented in a general way his views on what should be the guiding principles of the Nation's foreign policy. He demanded "a friendly attitude of mind" toward other peoples, and the adoption of "proper instruments and institutions" for maintaining international relations. Among these he mentioned the World Court. He spoke also on behalf of limitation of armaments, and for "intellectual and moral disarmament."

In a speech, May 15, at Williamsburg, Va., at the celebration of the sesqui-centennial of the adoption of the Virginia independence resolutions, the President declared that "the States should not be induced by coercion or by favor to surrender the management of their own affairs," and warned against the tendency to enlarge the sphere of Federal activity. Before the congress of the Pan-American Red Cross at Washington, May 25, he advocated the policy of international coöperation in the field of this society. A warning against increase in the cost of governmental bodies other than Federal was expressed in an address, June 20, before business heads of the administration. A speech at the Philadelphia Sesqui-Centennial, July 5, expressed the President's views on American ideals in the political realm as founded on moral and religious conceptions.

President Coolidge's Armistice Day speech at Kansas City, Mo., contained a statement of his intention not to ask the Senate to modify its reservations, in any further effort to effect entry of the United States into the World Court. He spoke also of the need for adequate national defense, and referred to reports of ill feeling toward America in Europe.

Carmi A. Thompson of Ohio, a personal friend of President Coolidge, was deputed by the President, April 2, to visit the Philippine Islands and study their economic and political conditions and needs, on which he was thereafter to report to the President. After an extended tour through the islands and conferences with native leaders and American residents and authorities, Colonel Thompson submitted, December 4, a report to President Coolidge on his observations as to the state of the Philippines. This report, as published December 22, recommended an indefinite postponement of the granting of independence to the islands and the gradual extension of internal autonomy to them. See PHILIPPINES.

President Coolidge issued, May 21, an executive order giving permission to persons already in the official service of States or of State subdivisions to serve simultaneously as Federal officers, at nominal salaries, and thereby to gain authority to cross county and State boundaries in proceeding against offenders under the Federal Prohibition statutes. The order ran contrary to the tenor of a preceding order as to dual service, that issued by President Grant in 1873, declaring the dual relation forbidden. The Coolidge order gave immediate occasion for nation-wide discussion, and, encountering much adverse comment, was not at the time universally applied.

Georges Clémenceau, retired French statesman,

addressed to President Coolidge in August an open letter of protest against the policy of the United States Government in regard to the funding of the War debt of the French Government, which policy he characterized as too severe to permit of the maintenance of French economic independence. The communication being unofficial, President Coolidge, refrained from commenting on it or replying to the writer.

President Coolidge arrived, July 7, for a stay of two months at Lake Osgood, in the Adirondacks, New York State. While absent from the capital the president refrained almost altogether from taking a part in the campaign for the election of the members of the 70th Congress. He made an exception in the case of Senator Butler of Massachusetts, in a statement in which he characterized Mr. Butler as valuable to the Administration and as an interpreter and supporter, in the capitol, of the Administration's plans. Mr. Coolidge returned to Washington September 18.

The President's father, John C. Coolidge, died March 18, at the family home at Plymouth, Vt., his death occasioning a brief trip of the President and Mrs. Coolidge to Plymouth.

**CABINET.** The composition of the Cabinet remained unchanged throughout 1926, being as follows: Secretary of State, Frank B. Kellogg; Secretary of the Treasury, Andrew W. Mellon; Secretary of War, Dwight F. Davis; Attorney-General, John G. Sargent; Postmaster-General, Harry S. New; Secretary of the Navy, Curtis D. Wilbur; Secretary of the Interior, Hubert Work; Secretary of Agriculture, William M. Jardine; Secretary of Commerce, Herbert C. Hoover; Secretary of Labor, James J. Davis.

**FOREIGN RELATIONS.** Customs increases in Turkey applying to American goods, and interpreted as amounting to eight times the duty levied on goods of other countries protected by commercial treaties, occasioned the lodging of a protest by the United States January 7. The Lausanne Treaty, establishing relations with Turkey, was not ratified during the year.

The force of marines at Bluefields, Nicaragua, was withdrawn June 5.

Secretary Kellogg, March 2, addressed to the Mexican Ambassador a supplementary note on the matter of the Mexican land laws as affecting the rights of American owners.

General Lassiter, chairman of the Tacna-Arica plebiscite commission, presented to the commission, June 10, a resolution declaring that it was impossible to carry out the plebiscite.

A treaty establishing closer relations between the United States and Panama was signed July 28. The terms of this treaty, published December 20, provided for the coöperation of the Republic of Panama with the United States in case of war. See PANAMA.

The Supreme Council of the Knights of Columbus, a national organization of Roman Catholic laymen, issued, August 7, a statement in which it protested against the enforcement of the Mexican laws regulating religious bodies, aimed at its coreligionists; it called for the withdrawal of the standing embargo on the shipment of arms to Mexican destinations; and urged that the United States extend protection to American citizens affected by Mexican governmental activity.

Because of its regulations and proceedings against the Roman Catholic clergy, the Govern-

ment of Mexico was condemned by lay organizations of that faith in the United States, and on August 13 James A. Flaherty, Supreme Knight of the Knights of Columbus, requested Secretary of State Kellogg to intervene in Mexico on the behalf of oppressed members of the faith. Secretary Kellogg declined to proceed upon the issue. James R. Sheffield, ambassador to Mexico, returned from his post and, August 25, reported to the Secretary of State at Washington. Soon thereafter he conferred with President Coolidge at the President's summer camp. Later, on September 8, the President stated that no change in the policy with regard to Mexico was contemplated. Allegations had been published in the meantime to the effect that shipments of arms to the Nicaraguan Liberal group, waging war on the administration in power, were passing from Mexican ports by sea. Gunboats of the United States Navy were reported, August 25, ordered to the Nicaraguan coast to prevent further such introduction of arms. The United States extended its good offices, September 12, to settle the Nicaraguan conflict.

The Department of State concluded, November 17, a treaty with Spain for the prevention of shipment of alcoholic liquor to the United States; this being the twelfth agreement of this kind concluded with a foreign government.

The approaching end of the year, bringing near the date of enforcement of the Mexican Federal laws curtailing the ownership, by Americans and other aliens, of lands in Mexico, led the State Department to renewed correspondence with the Mexican Government on the subject. Secretary of State Kellogg, October 30, and in subsequent notes, insisted that acceptance of the Mexican regulations amounting to partial expropriation of American property would be incompatible with the duty of the United States Government to protect its citizens' interests. Warships under Rear Admiral Latimer were ordered, December 7, to stations at Nicaraguan ports, with direction definitely to prevent the importation of arms into the country by the Sacasa faction. The action of the Mexican Government, taken at the same time, in granting recognition to the Sacasa government, placed the State Department in sharp opposition to Mexico. Admiral Latimer landed a force of marines, December 23, at Puerto Cabezas, the headquarters of the Sacasa party, declared the town neutral, and, according to press dispatches, required Sacasa and his followers to disarm or depart. The State Department issued a statement to the effect that appeals for protection had been received from American citizens in this area, and that Admiral Latimer had been instructed to afford them protection. See NICARAGUA.

Following the failure of the administration's efforts to bring about the Tacna-Arica plebiscite provided in the American arbitral award in the dispute between Chile and Peru, Secretary of State Kellogg presented a plan of solution, November 30, providing for the sale of the disputed area to Bolivia. Bolivia immediately expressed assent to the proposals, and the Chilean administration signified its acceptance of the plan in principle, leaving details for discussion. The unwillingness of Peru to part with its claims to the provinces on these terms caused delay in the Peruvian response.

THE SECRETARY OF THE TREASURY. Secretary

of the Treasury Mellon issued, January 4, a statement in support of the debt-funding agreements reached with Belgium, Italy, and other countries, as based on the economic ability of the debtor countries and as necessary to sound future economic relations between these countries and the United States. Early in June, Mr. Mellon expressed, in a communication to Representative Haugen, what was deemed the Administration's opinion against the McNary-Haugen bill for agricultural price correction. His words, "we shall have the unusual spectacle of the American consuming public paying a bonus to the producers of the five major agricultural commodities," were widely quoted, and drew much comment. The Secretary, in a letter to Senator Smoot, June 30, and again in November, following the tax rebate proposal emanating informally from the White House, expressed opposition to definitive tax reduction, and proposed retirement of indebtedness as whole or partial employment for Treasury surplus. A declaration of Secretary Mellon, in a letter to F. W. Peabody of Ashburnham, Mass., July 14, was published, and brought forth a rejoinder from the British Government, in statements to Parliament. These statements were elicited by Secretary Mellon's view that "England borrowed a large proportion of its debt to us for purely commercial as distinguished from war purposes. . . . Our loans to England were not so much to provide war supplies as to furnish sterling for home and foreign needs, and to save England from borrowing from its own people." In an extended statement, October 24, Mr. Mellon defended the United States tariff system.

DEPARTMENT OF JUSTICE. Prominent among the proceedings of the department were two anti-trust suits, one against the National Food Products Corporation and one against the Ward Food Products Corporation. In the first of these suits, a consent decree was obtained, March 4, to prevent the National Food Products Corporation from combining chain-store groceries and dairy concerns. The Ward Food Products Corporation was in like manner prevented, by a consent decree entered April 3, from achieving a combination of three great baking companies, the Continental, the Ward and the General. Prosecutions under the national Prohibition act in the fiscal year, it was stated, resulted in sentences aggregating 5666 years, an increase of 1097 years over the highest previous annual aggregate, and in imposition of fines to the total of \$7,494,269. The oil-cracking suit instituted in 1924 against the Standard Oil Co. of Indiana, the Standard Oil Co. of New Jersey, the Texas Company and others, over the pooling of patents on the cracking process for production of gasoline, was extended by a supplementary petition allowed May 3, alleging that certain of the patents in question had been obtained by fraud. The case was brought to trial before a master in chancery in the northern district of Illinois. Cases against the United States in the Court of Claims numbered 2033 at the end of the fiscal year, with claims to the aggregate of \$1,744,817,495. The Federal penitentiaries were increasingly overcrowded, prior to the opening of the new reformatory at Chillicothe. The Atlanta penitentiary had in the year an average of 2972 inmates; the Leavenworth penitentiary, 3093; McNeil Island, 631. The Industrial Reformatory at Chillicothe, while formally put in service in

March, had to be reconditioned before being put to extensive use.

**CIVIL SERVICE.** The number of those employed in the executive civil service declined by 4013 in the fiscal year ending June 30, 1926. There were 202,846 persons examined for classified service, and 38,916 persons appointed.

**OTHER ADMINISTRATIVE ACTIVITIES.** The head of the Federal Prohibition Enforcement Bureau, General Andrews, made in the early part of the year a trip to several countries of Europe. He treated with the authorities there, in regard to details of steps to be taken to stop illicit importation of alcoholic drink into the United States by sea, as provided in agreements negotiated with those countries.

The Federal authorities refused permission to Madame Kollontai, the woman envoy of the Russian Soviet Government to Mexico, to enter United States territory on her journey from Europe to Mexico. She went accordingly by way of Cuba, reaching Mexico City December 8.

F. Trubee Davison was appointed Assistant Secretary of War for Aviation, and Edward P. Warner Assistant Secretary of the Navy for Aviation, the Senate confirming both July 2. The President appointed William P. MacCracken, Jr., of Chicago, August 9, to be Assistant Secretary of Commerce with charge of civil aviation development.

Sentence upon Col. William Mitchell, the United States Army air officer found guilty by a court martial for criticizing the air activities of the War and Navy Departments, was modified by President Coolidge, January 25. The President confirmed the five years' suspension of Mitchell from service, but restored his allowances and one-half his base pay. Colonel Mitchell tendered his resignation from the Army January 27, and it was accepted.

The Sugar Equalization Board, formed in war time, was dissolved July 13. Its activities, mainly in the stabilization of prices on the 1917-1918 sugar crop, had yielded a total profit of some \$41,000,000.

The Federal Trade Commission made recommendations, September 5, that the prevailing practices in trading in contracts for future delivery of grain be modified.

To the board of mediation created by the law which abolished the Railway Labor Board, President Coolidge appointed Samuel E. Winslow, of Massachusetts, Edwin P. Morrow, of Kentucky, G. Wallace Hanger of the District of Columbia, Hywel Davies of California, and Carl Williams of Oklahoma. Under the Watson-Parker act, a Federal board of arbitration awarded, Dec. 2, wage increases averaging  $7\frac{1}{2}$  per cent to conductors and trainmen on the railroads of the Eastern section, totaling about \$15,000,000 a year, and settling a labor dispute of several months' standing.

The Shipping Board removed Capt. Elmer E. Crowley from the position of president of the Emergency Fleet Corporation, July 9, following differences as to policy. It elected as his successor Brig. Gen. A. C. Dalton. The Shipping Board voted May 26, by a vote of 4 to 2, to permit the sale of five lines of the American Oriental Mail to R. Stanley Dollar of San Francisco.

The Federal Oil Conservation Board opened hearings at Washington, February 10, with a view to laying plans to retard oil exhaustion. The report of the Board, published September 5,

stated the present available reserve of petroleum in the ground to be some 4,500,000,000 barrels, approximately six years' supply, only the oil in proved areas being reckoned. It placed the domestic investment in oil production at \$9,500,000,000. While extensive discussion had taken place in the Board's hearings as to whether more economical petroleum production was secured by coöperation or by single exploitation in individual fields, the report made no conclusive recommendations on this feature of the problem. It recommended extension of acquisition and development in foreign petroleum fields.

Reports of Canadian and American engineers on projects for the development of the St. Lawrence River as a waterway and source of hydro-electric power were submitted November 23. They differed in detail, the Canadian group favoring double-stage power dams, development of 2,619,000 h.p. and a total outlay of \$308,792,000; the American group advocated single dam development to provide 2,730,000 h.p. at a cost of \$290,172,000, of which \$167,720,000 represented the cost of navigation development.

**JUDICIARY.** *Progress of the Oil Cases.* The Circuit Court of Appeals, January 4, upheld the lower court in regard to its disposal of the Elk Hills naval oil reserve lease cancellation suit. A decision of the Circuit Court of Appeals, September 28, reversed that of Judge Kennedy in the lower court; it canceled as fraudulent the lease of the Teapot Dome area to the Sinclair interests and enjoined the Mammoth Oil Company, the operating organization, from trespass. Defendants' appeals against the District of Columbia indictments for conspiracy against Fall, Doheny, and Sinclair, were dismissed by the Court of Appeals of the District, October 2. The criminal suit against former Secretary of the Interior Albert B. Fall and the petroleum operator, Edward L. Doheny, for alleged conspiracy in the leasing of the Elk Hills naval oil reserve, on indictments found in the District of Columbia in 1924, was brought to trial in the District of Columbia court November 22. The jury rendered a verdict of acquittal, December 16, after a deliberation of 19 hours. Justice Bailey ruled, December 23, that the case involving charges against Fall and Harry F. Sinclair, of conspiracy in the leasing of the Teapot Dome naval oil reserve, should come to trial in the Supreme Court of the District of Columbia Feb. 2, 1927.

*Presidential Power of Removal.* Chief Justice Taft, in an opinion rendered in the Supreme Court, October 25, in the appeal of Myers vs. the United States, held that Myers, a first-class postmaster at Portland, Ore., removed in 1920 by the Postmaster General, under direction of the President, in apparent contravention of an act of 1876 restricting Presidential power of removal of postmasters without Senate consent, was removed validly. The opinion went extensively into the general question of the constitutionality of statutory measures of restriction on the Executive power of removal, and laid down a broad doctrine of the invalidity of legislative curtailments of this power.

*Decisions Relative to Prohibition.* The Supreme Court in a decision rendered November 29 affirmed the constitutionality of the Prohibition law in respect to restricting the medical prescriptions of alcoholic beverages. The court was divided 5 to 4.

The question whether the prosecution of an

offender against prohibition laws, in both Federal and State courts, for the same act, under concurrent laws of the Union and of the individual State, imposed double jeopardy forbidden in the Constitution, was passed upon by the Supreme Court Nov. 1 in a case of alleged double prosecution. The court found that an offense against a Federal statute and one against a State statute constituted two distinct offenses, even though they were comprised in a single act; it held, accordingly, that double prosecution did not in such case occasion double jeopardy.

**Statutory Prohibition of Strikes.** Justice Brandeis of the U. S. Supreme Court, in a decision rendered October 25 in *Dorchy vs. the State of Kansas*, sustained the constitutionality of the Kansas court of industrial relations act, in respect to its provision for punishing anyone inducing or ordering others to take part in an unjustifiable strike. This provision of the act was specifically held to remain valid, in spite of an earlier Supreme Court decision invalidating that portion of the act which provided for compulsory arbitration.

**Alien Property Prosecution.** Former Attorney General Harry M. Daugherty and former Alien Property Custodian Thomas H. Miller were charged, May 7, by a Federal indictment, with conspiracy to defraud the Government, in regard to the disposal of a seized concern, the American Metal Company, to representatives of the former alien enemy owner interests. They were placed on trial September 5 in the Federal District Court at New York. Mal S. Daugherty, an official of the Midland National Bank, of Washington Court House, Ohio, testified that his brother, Harry M. Daugherty, destroyed bank records which the prosecution wanted produced to show money payments asserted to have been made to the defendant's benefit. The jury failed to agree.

**UNITED STATES MILITARY ACADEMY.** A government institution at West Point, N. Y., for the theoretical and practical training of cadets for the military service of the United States; opened in 1802. On Sept. 1, 1926, the total number of cadets was 1174, distributed as follows: first class, 210; second class, 263; third class, 345; fourth class, 356. There were 169 members on the faculty. The academy is a component part of the regular army of the United States and is maintained solely by appropriations from the War Department, which in 1926 were \$970,131 for salaries and the maintenance of public works, and \$700,000 for continuing construction. A new mess hall, cadet store, dormitories, and a drawing academy were under construction during the year. The library contained 108,000 volumes. Superintendent, Brigadier General Merch B. Stewart, U. S. A.

**UNITED STATES NAVAL ACADEMY.** A school for the education and training of midshipmen, at Annapolis, Md.; founded in 1845. The total number of midshipmen at the beginning of the academic year 1926-27 was 1695, distributed as follows: first class, 589; second class, 213; third class, 316; fourth class, 577. The faculty numbered 209. The library contained 63,390 volumes. Midshipmen after graduation are commissioned as ensigns in the United States Navy, and occasionally to fill vacancies in the Marine Corps and in certain staff corps of the Navy. Appointments for admission to the Academy are made by each Senator, Representative, and Delegate in Congress, and appoint-

ments from the District of Columbia and the United States at large are made by the President. Also, the Secretary of the Navy is authorized to appoint annually 100 enlisted men of the regular Navy and Marine Corps, and 25 enlisted men of the Naval Reserve and the Marine Corps Reserve. Superintendent, Rear Admiral L. M. Nulton, U.S.N.

**UNIVERSALISTS.** A religious denomination existing chiefly in the United States, Canada, and Japan. It holds as parts of its doctrine, the universal fatherhood of God and the final harmony of all souls with God. Its churches are grouped in 28 State conventions and eight State conferences. A general convention, held biennially, met in 1925. The number of churches in 1926 was 624; ministers, 348; communicants and adherents, 88,097; Sunday schools, 440. The denominational periodical, the *Christian Leader*, is published weekly. Headquarters of the denomination are at 176 Newbury Street, Boston. The Rev. John Murray Atwood was president of the general convention.

**UNIVERSITIES AND COLLEGES. STATISTICS.** The latest available statistics for universities, colleges, and professional schools at the end of 1926 were those reported by the United States Bureau of Education for the year ending June, 1924. Briefly summarized, the statistics are as follows: There were 913 universities, colleges and professional schools that reported. Of these 144 were under public control. There were 165 schools of theology, 124 schools of law, 80 schools of medicine, 43 schools of dentistry, 63 schools of pharmacy, 6 schools of osteopathy, and 12 schools of veterinary medicine.

There were 44,345 men and 11,934 women employed as professors and instructors.

The total number of students enrolled in all of the institutions was 726,124. Of this number, 457,701 were men, and 268,423 were women. There were 18,444 men and 10,355 women in graduate departments. Schools of theology enrolled 12,356 students; schools of law, 35,732; schools of medicine, 18,900; schools of dentistry, 12,947; schools of pharmacy, 9951; schools of osteopathy, 1117; and school of veterinary medicine, 511. The schools of engineering enrolled 57,699 students.

The value of the grounds belonging to all of the institutions was \$168,257,572. The estimated value of the buildings was \$137,417,736; of libraries, apparatus, and furniture, \$175,323,131; and the productive funds amounted to \$814,718,813.

The total receipts for the year ending June, 1924, were \$388,242,567. The following amounts were received from the sources indicated: Student fees, \$81,171,612; room rent and board, \$36,963,607; productive funds, \$40,431,608; State and city, \$96,252,549; United States Government, \$13,641,424; and private benefactions for endowments, increase of plant, and current expenses, \$81,734,738.

The enrollment in institutions of higher learning had increased more than 445 per cent in the 34 years since 1890. This was about six times as great as the increase in population for the same period. During this same period, however, the number of those enrolled in the secondary schools and preparing for college increased .951 per cent, or more than twice the increase in college enrollment.

Prof. Raymond Walters collected statistics of registration for 1925-26 from 178 institutions

on the approved list of the Association of American Universities. The tabulated results appeared in *School and Society*, Jan. 8, 1927. The enrollment of full-time students was 11 per cent greater than in the preceding year.

The enrollment of full-time regular students in the 10 largest universities was as follows: California, 17,101; Columbia, 12,643; Illinois, 11,810; Minnesota, 10,718; Michigan, 9,597; New York University, 9,357; Ohio State, 9,209; Pennsylvania, 8,533; Wisconsin, 8,220; and Harvard, 7,993. The enrollment of all resident students including part-time and summer session students in 5 of the larger institutions was as follows: Columbia, 30,562; California, 24,756; New York University, 20,504; College of the City of New York, 17,438; and Minnesota, 15,585.

The following statements are quoted from the report:

The enrollment of men undergraduates in the five largest liberal arts colleges or departments is as follows: California (including southern branch), 3,851; Wisconsin, 3,504; Michigan, 3,348; College of the City of New York, 3,287; Harvard, 3,278.

The size order for women undergraduate enrollment in the five largest coeducational universities is as follows: California (including southern branch), 5,458; Wisconsin, 2,660; Illinois, 2,107; Minnesota, 1,787; Michigan, 1,512.

The ten largest exclusively women's colleges are Hunter, 3,448; Smith, 2,085; Wellesley, 1,546; Florida State College for Women, 1,318; Vassar, 1,144; Goucher, 1,046; Mount Holyoke, 1,006; Radcliffe, 849; Randolph-Macon Woman's College, 822; Elmira, 582.

The order of size in the 1926 summer schools, for the ten largest, is as follows: Columbia, 13,219; California, 10,668; Chicago, 6,532; Wisconsin, 5,060; Minnesota, 4,867; University of Southern California, 4,018; College of the City of New York, 3,526; Nebraska, 3,355; Michigan, 3,320; Colorado, 3,227; Texas, 2,972.

The American Association of University Professors, through a committee, gave consideration to the problems involved in the selection, retention, and promotion of undergraduates. The report voices the fear that, in the limitation of numbers, worthy students will not be discovered. Among the proposals offered in regard to the selection of students are the following: Each institution should determine the largest number of undergraduates that it can teach effectively, then limit their enrollment to this number and make public announcement of such limitation. There should be a director of admissions who should be chairman of the faculty committee, with authority to act. Graduation of candidates should be on the basis of intellectual achievement and promise. No one should be admitted with conditions. Intelligence tests to supplement other tests should be used, but not as a substitute for scholastic preparation. The comprehensive examinations in four fundamental subjects, with reasonable flexibility in others, should be adopted. Every college should establish scholarships, and revolving or other loan funds which may be used to help unusually gifted students who could not, without such financial assistance, apply their whole effort to the college work.

**NEW PRESIDENTS.** During the year the following new presidents of universities and colleges were reported: J. C. Carmichael was made president of the Alabama College for Women, at Montevallo, to succeed the late Dr. T. W. Palmer. Dr. James Albert Beebe was elected president of Allegheny College, Pittsburgh, Pa. Dr. J. A. Rolman became president of Anderson College, Anderson, S. C. Dr. J. R. Grant accepted the

presidency of Arkansas Polytechnic College. Dr. Harry Lathrop Reed was installed as president of Auburn Theological Seminary, Auburn, N. Y. Prof. E. B. Gates was elected president of Blackstone College, Richmond, Va. Dr. David D. Jones was chosen the new president of Bennett College for Women, Greensboro, N. C. Daniel L. Marsh became the president of Boston University. Dr. Park R. Kolbe was inaugurated as president of Brooklyn, N. Y., Polytechnic Institute. Frederic R. Hamilton was made president of Bradley Polytechnic Institute, Peoria, Ill.

Dr. Carlyle Campbell was elected president of Coker College, Hartsville, S. C. Dr. Samuel J. Vaughn became president of Colorado Women's College, Denver, Colo. Samuel H. Whitley was inaugurated as president of East Texas State Teachers' College. Thomas Elsa Jones was elected president of Fisk University, Nashville, Tenn. Supt. Harvey Allen was made president of Findlay College, Findlay, Ohio. Dr. Charles M. Snelling was elected Chancellor of the University of Georgia, Athens, Ga., to succeed Dr. David C. Barrows. Mordecai W. Johnson was appointed president of Howard University, Washington, D. C., its first negro president. Clarence Paul McClelland, D.D. was inaugurated as president of Illinois Woman's College, Jacksonville, Ill. Dr. Albert Britt was made president of Knox College, Galesburg, Ill. Col. Campbell C. Hodges was elected president of Louisiana State University, Baton Rouge, La.

Dr. Harold S. Boardman was installed as president of the University of Maine, Orono, Me., to succeed Dr. C. C. Little. A. C. Olney accepted the presidency of Marin County Junior College, California. Dr. Raymond Allen Pearson accepted the presidency of the University of Maryland, Baltimore, Md. Edward M. Lewis was made president of Massachusetts Agricultural College, Amherst, Mass. Bishop U. V. W. Darlington became president of Morris Harvey College, Barboursville, Va. Bowman W. Ashe became president of the University of Miami, Florida. George W. Rightmire was chosen president of Ohio State University, Columbus, Ohio. Dr. A. E. Vestling was made president of Olivet College, Olivet, Mich. Dr. Arnold Bennett Hall was inaugurated as president of the University of Oregon, Eugene, Ore.

A. B. Hill, State Superintendent of Arkansas, was made president of Ouachita Baptist College, Arkadelphia, Ark. Dr. Ralph D. Hetzel was elected president of Pennsylvania State College, State College, Pa. The Rev. C. J. McCoy was made president of the University of Santa Clara, California. Miss Marion Coates was to be the first president of the new junior college at Bronxville, N. Y. This college was to be known as the Sarah Lawrence College. Dr. Joseph A. Cooper was elected president of Sioux Falls University, Sioux Falls, S. D. Ludd M. Spivey was inaugurated president of Southern College, Lakeland, Fla. Charles E. Beury was elected president of Temple University, Philadelphia, Pa., to succeed the late Russell H. Conwell. James L. Robb was made president of Tennessee Wesleyan College.

L. H. Hubbard was chosen president of Texas College of Industrial Arts. Dean E. Clyde Zander began work as president of Thiel College, Greenville, Pa. Dr. E. A. Smith was elected president of the University of Toledo. The Rev. Dr. Henry

Sloane Coffin, for 21 years pastor of the Madison Avenue Presbyterian Church, New York, was inaugurated president of Union Theological Seminary, New York, to succeed the Rev. Dr. Arthur C. McGiffert. The Rev. Benjamin Rice Lacy became president of Union Theological Seminary, Richmond, Va. C. B. Goulding was elected president of Urbana Junior College, to succeed President Henry Schradeich.

W. H. T. Dau was made president of Valparaiso University, Valparaiso, Ind. The Rev. James Griffith was appointed president of Villanova College, Villanova, Pa. Louis B. Hopkins was elected president of Wabash College, Crawfordsville, Ind., and Clarence A. Short of Wesley Collegiate Institute, Dover, Del. Dr. Homer E. Wark was inaugurated president of West Virginia Wesleyan College, Buckhannon, W. Va. Rev. John Edgar Park was elected to succeed the late Dr. Samuel V. Cole as president of Wheaton College, Norton, Mass.

**GIFTS AND BENEFACTIONS.** Gifts of \$100,000 and more are given below:

Barnard College received \$110,000 from the late Mrs. Mary E. Larkin Joline. Frank A. Munsey left by will \$250,000 to Bowdoin College. Hegeman Hall, Brown University, was built by a gift of \$250,000 from the estate of John R. Hegeman. The University, of Buffalo received \$100,000 from the late John D. Larkin for the endowment of the school of chemistry. William Randolph Hearst gave \$1,000,000 to the University of California. The Southern Branch of the University of California received nearly \$5,000,000 from William A. Clark, Jr. Columbia received from Frederick W. and Harold S. Vanderbilt \$500,000 to rebuild the Vanderbilt Clinic at the new medical centre and from Mrs. Annie C. Kane \$1,000,000. The University of Chicago received from Frank P. Nixon \$200,000 toward the development fund; from the Carnegie Corporation \$1,385,000, to establish a library school; from the General Education Board \$3,385,000 for the new medical school, condition upon raising \$2,000,000 more; from George Herbert Jones, a director of the Inland Steel Co., \$415,000 to be used for the construction of a chemical research laboratory.

The Connecticut College for Women was to receive over \$100,000 from D. H. Fanning of Worcester, Mass. Dartmouth College received an anonymous gift of \$1,000,000. The University of Denver received a gift of \$100,000 from Verner Z. Reed. James L. Minor gave property valued at \$100,000 to the George Peabody College for Teachers. Harvard received over \$3,000,000 from the estate of Augustus Coe Burnee; from Mrs. Elizabeth Clark Rogers, \$300,000 for the medical school; from the alumni, \$500,000; from the General Education Board a conditional \$750,000 toward legal research.

The committee of the Hampton-Tuskegee Universities Endowment Fund announced that \$5,000,000 to be pledged to meet the conditions of a \$2,000,000 gift from George Eastman had been obtained; John D. Rockefeller, Jr. gave \$1,000,000 of it. Johns Hopkins received two gifts of \$100,000 each from Mr. and Mrs. Henry Walters and Mr. R. Brent Keyser. Illinois Wesleyan University received an annuity gift of \$100,000 from Dr. George C. Lewis and Mrs. Ella Beach Lewis. King's College at Bristol, Tenn., received \$100,000 from Richard S. Reynolds. Leland Stanford, Jr., University and the California Institute

of Technology received grants amounting to \$600,000 from the Daniel Guggenheim Fund for Promotion of Aeronautics. Charles Hayden, a New York banker, gave \$100,000 to the Massachusetts Institute of Technology for dormitories. The new University of Miami received land and cash to the value of \$5,000,000 from George E. Merrick, the founder of Coral Gables; \$1,000,000 from Victor Hope, real estate dealer; \$200,000 from J. C. Penney, head of a chain of department stores; \$100,000 from Frederic Zeigen, banker; \$100,000 from Frank B. Shutts, lawyer and publisher; \$100,000 jointly from Thomas O. H. Dupre and Dr. C. A. Hassell, real estate men; \$100,000 from Vance Helm and associates; and \$100,000 from W. E. Walsh and associates.

Robert P. Lamont, president of the American Steel Foundries Co., gave to the University of Michigan \$100,000 for a Woman's League building. Mount Union College received \$300,000 from the General Education Board for its endowment. New York University received \$602,168 from the Nichols Foundation, Inc., to construct the William H. Nichols Building for chemistry. Northwestern University received from Mrs. A. Montgomery Ward \$4,000,000 for the use of the medical and dental schools, and \$100,000 from the Carnegie Corporation of New York for the school of music. L. Wentz established a foundation and endowed it with \$100,000 as a loan fund for students of the Oklahoma Agricultural and Mechanical College and the University of Oklahoma.

The University of Pennsylvania received from Mr. and Mrs. Henry Phipps \$500,000 to be devoted to the welfare of Phipps Institute, founded by Mr. Phipps; also \$100,000 from the children of Dr. C. C. Harrison in the interest of the museum; and from Martin Maloney \$250,000 for a medical clinic building.

A new institution announced during the year, and typical of increased interest in Spanish relations and studies, was a centre for Spanish scientific men in New York. The Spanish government was to furnish the site. Princeton University received a share in the residuary estate of Mrs. Mary E. Larkin Joline amounting to \$100,000; from Edward W. Bok \$150,000 to endow a chair of English to be known as the Woodrow Wilson Professorship of English; from the General Education Board \$1,000,000 for chemistry, conditional upon raising \$2,000,000 more; from Charles W. Lummis the residue of his estate, which is to be used for scholarships when it accumulates to \$200,000; from John Kennedy Tod, retired banker, \$250,000; from Thomas D. Jones \$150,000; from John D. Rockefeller, Jr. \$150,000 for additions to the gymnasium.

Rollins College received \$100,000 from Mrs. Homer Gage and Mrs. George E. Warren. The late Dr. Dwight William Tryon left to Smith College the sum of \$355,340; Dr. Tryon was head of the art department for 33 years. A fund of more than \$100,000 was donated to Swarthmore College by Mrs. Isaac H. Clothier of Philadelphia. Talladega College, Alabama, will receive over \$100,000 from the late D. H. Fanning of Worcester, Mass.

Teachers College, Columbia University, received \$300,000 by the will of Mrs. Mary Clark Thompson, and \$100,000 from Mrs. Richard M. Hoe. The late William J. McDonald bequeathed the residue of his estate, approximately \$1,490,-

000, to the University of Texas for an astronomical observatory. The sum of \$150,000, which was left by the late Charles W. Cook for a dormitory for Trinity College, has been released by the death of Miss Jennie M. Cook. Tufts College received the sum of \$135,000 by the will of Eugene M. Niles. The late William Ratcliffe Irby left about \$1,000,000 to Tulane University.

Tuskegee Institute received \$650,000 from Mrs. Annie C. Kane. Vanderbilt University received \$650,000 from five members of the Vanderbilt family.

Vassar College received \$300,000 by the will of Mrs. Mary Clark Thompson. The University of Virginia received \$100,000 from the General Education Board. Through an anonymous gift of \$100,000, Washington College, Topeka, Kan., established a course in Americanism. Horace C. Henry, of Seattle, Wash., gave his \$400,000 art collection to the University of Washington, and offered to furnish a new \$100,000 building to house it. Washington University at St. Louis received \$100,000 from Mrs. William Eliot Smith. Henry I. Harriman gave \$200,000 to Wesleyan University for a dormitory to house 100 students. Wesleyan College, Macon, Ga. (for women) received \$100,000 from B. M. Duke.

Western Reserve University received a grant of \$975,000 from the General Education Board, for medical work. Williams College received \$300,000 from Mrs. Mary Clark Thompson. Yale received from William W. Crapo \$100,000; from George St. John Sheffield \$600,000 and to the Sheffield Scientific School was granted \$300,000 under the same will. Yale also received from the sons and daughters of Charles Bingham \$1,000,000, half to be used for a dormitory.

**EDUCATIONAL BOARDS AND FOUNDATIONS.** *The Carnegie Corporation* is discussed in a special article under that head.

*The Carnegie Foundation for the Advancement of Teaching.* The total resources of the foundation are \$29,356,000. Of this, \$15,860,000 is held as general permanent endowment, \$1,346,000 as endowment for the Division of Educational Enquiry, \$11,032,000 as a reserve for liquidating pension obligations after 1928, \$793,000 to assist institutions to adopt the new contributory plan of retiring annuities; and \$525,000 as emergency reserve.

*The Commonwealth Fund.* The seventh annual report of the Commonwealth Fund showed endowment amounting to \$27,761,000, Sept. 30, 1925. Since then Mrs. Stephen V. Harkness, the founder of the fund, had donated \$11,000,000 more. Gifts for the fiscal year ending Sept. 30, 1925, amounted to \$1,339,000. Approximately \$847,000 was given to different organizations having to do with child welfare. A total of \$425,000 was appropriated to four organizations which deal with child guidance and the prevention of delinquency. Appropriations totaling \$241,000 were made for the child health program, which includes community demonstrations in Fargo, N. D.; Athens, Ga.; Rutherford County, Tenn.; and Marion County, Ore. A grant of \$100,000 was made for a child health programme in Austria. The division of education awarded 20 fellowships to British graduate students for study in American universities. The appropriation for these scholarships was \$112,000. Educational research cost \$85,000.

*Laura Spelman Rookefeller Memorial.* The report of this foundation for 1925 showed that ap-

propriations amounting to \$7,882,890 had been made. Of this sum, \$3,495,960 was paid during the year. The income for the year was \$4,096,437. Among the various gifts that were made the following are noteworthy: For fellowships in the field of social science, \$155,000 was appropriated, for the support of 37 fellowships in foreign countries. The sum of \$40,000 was appropriated for 15 fellows in the United States. A total of \$787,800 was appropriated for child study and parental education.

**NEW INSTITUTIONS AND DEPARTMENTS.** *Aéronautics.* The Daniel Guggenheim Fund for the Promotion of Aeronautics announced two grants to California institutions. See **AERONAUTICS**.

*Bryan Memorial University.* The Governor of Tennessee formally accepted the site for the Bryan Memorial University, at Dayton, Tenn. Ground was broken for an administration building, and gifts were received for other buildings.

*The Juilliard School of Music.* Under the provisions of a charter granted to the Juilliard School of Music, the Institute of Musical Art of New York City and the Juilliard Graduate School of Music were merged. The Institute of Musical Art had been in operation for many years, and in 1926 had more than 1000 students. The Juilliard Graduate School of Music was organized in 1923 and in 1926 had about 175 students. The new institution was to have an endowment of at least \$1,000,000, which may be used for scholarships.

*Graduate Library School at the University of Chicago.* A graduate library school was established at the University of Chicago. A gift from the Carnegie Corporation made this school possible. The announcements of the school indicate a wide range of technical courses as well as general cultural courses.

*New School of Library Science at Columbia University.* The New York State Library at Albany and the Library School of the New York Public Library were combined to form the School of Library Service of Columbia University. See **LIBRARY PROGRESS**.

*Scripps College for Women.* Plans were under way for the opening in September, 1927, of a new college for women at Claremont, Calif., named Scripps College, which was to be a part of the scheme of collegiate federalism known as "Claremont Colleges" which had begun with Pomona College. In this scheme each college was to have its own board of trustees and its own faculty, its own buildings and equipment, but the opportunities of each college, such as admission to courses given in one and not in the others, were intended to be at the disposal of all students irrespective of the institution in which they were enrolled. The distinctive features of Scripps College were to be: Limitation of enrollment to 250 students; limitation of the curriculum to a certain number of basic subjects; and intimate and personal methods of instruction. It was planned to receive a freshman class of about 50. Students were to pay an inclusive fee of \$1000, to cover tuition, board, room and other incidental fees. Until sufficient accommodations could be provided students were to make use of such facilities as laboratories and library provided by Pomona College, although it was intended that Scripps College should gradually build up its own plant.

*Experimental College at University of Wisconsin.* The University of Wisconsin started an

experimental college to test new curricula and teaching methods for the freshman and sophomore years. The college opened with 125 freshmen. It is proposed to take 125 freshmen in September, 1927, making a total enrollment of 250 students. Enrollment was limited to men, and is voluntary. Dr. Alexander Meiklejohn, former president of Amherst College, is the director of the college. The students will live together in a dormitory. They will work under a tutorial system. The college will experiment with the plan of organizing the work of the entire freshman year about one ancient civilization such as the Greek, while the work for the second year may be organized in a similar manner about some modern civilization.

**University World Travel School.** On Sept. 18, 1926, the Holland-America liner *Ryndam* left New York with 500 students, including 120 young women, for an 8 months' cruise around the world. The vessel was expected to call at 47 ports and to travel 50,000 miles. The faculty included fifty members. The president of the school was Dr. Charles F. Thwing.

**UNIVERSITY PROFESSORS, AMERICAN ASSOCIATION OF.** See UNIVERSITIES AND COLLEGES.

**UPPER AUSTRIA.** A constituent province of the new republic of Austria since the formation of that state, Nov. 12, 1918; formerly a crownland of Austria, before the collapse of the Austro-Hungarian Empire. Area, 4626 square miles; population, according to the census of 1923, 873,702. Capital, Linz, with a population of 101,347 in 1923.

**UPPER SENEGAL AND NIGER.** A colony under the government-general of French West Africa; officially known since Dec. 4, 1920, as French Sudan. See FRENCH SUDAN and FRENCH WEST AFRICA.

**UPPER SILESIA.** See POLAND.

**URANIUM MINERALS.** See GEOLOGY.

**URUGUAY,** ū'ru-gwā or ōō'rōd-gwī'. A republic of South America, bounded by Bolivia, Argentina, and Brazil. Capital, Montevideo.

**AREA AND POPULATION.** Area, 72,163 square miles; population, estimated, Dec. 31, 1924, 1,662,116. The chief cities with their populations on Dec. 31, 1924, were Montevideo, 422,499; Paysandu, 26,000; Salto, 30,000; and Mercedes, 23,000. The movement of population in 1924 was: Births, 41,880; deaths, 19,132; marriages, 9173. The immigrants in 1924 numbered 158,533; the emigrants, 173,883. The immigrants came chiefly from Spain, Italy, Brazil, France, Germany, Great Britain, and Argentina.

**EDUCATION.** According to figures given in the president's message, 1069 public schools were in operation throughout the country during the school year of 1925; 3015 teachers were employed; the total enrollment of pupils amounted to 129,720, with an average daily attendance of 100,292. In addition, there were 64 night schools for adults, which were served by 378 regular and special teachers, with an enrollment of 7496 students and an average attendance of 4854; two schools for abnormal students, two deaf-mute schools, three open-air schools; one playground, and one school for abnormal children; also 21 traveling teachers, dental clinics, children's libraries, etc. Instruction was made more intensive in gymnastics, singing, modeling, dress-making, shopwork, commercial education, drawing, and languages. During the same year there were 153 private schools in the republic, as fol-

lows: Sixty-six elementary schools, 36 secondary schools, and 51 religious-order schools, or a total of 5 more than in 1924. The number of pupils in private schools was 19,156 in 1924, of whom 5610 went to lay schools, and 17,284 in 1925, of whom 3074 attended lay schools.

**PRODUCTION.** Uruguay is principally a pastoral country, 60 per cent of the total area being devoted to the stock-raising industry, 20 per cent to mixed farms and ranches, and only 5 per cent to agriculture. For the latest available statistics on agriculture and production in general, see preceding YEAR BOOK.

**COMMERCE.** According to the U. S. Bureau of Foreign and Domestic Commerce, the value of Uruguay's foreign commerce during the first six months of 1926 amounted to 97,124,050 pesos, as compared with 95,983,221 pesos during the same period in 1925, an increase of 1,140,829 pesos. Of these 1926 figures, 37,162,092 pesos represented imports and 59,961,958 pesos were exports.

**FINANCE.** The budget for 1925-26 called for a revenue of 43,086,702 pesos and an expenditure of 43,004,698 pesos. The public debt, on Dec. 31, 1925, was given as 119,545,857 pesos.

**COMMUNICATIONS.** In 1924, 11,341 steamers and sailing vessels, of 12,824,931 tons, entered the ports of the republic. Uruguayan railroads during the fiscal year ended June 30, 1926, showed an increase in net revenue from £741,642 in 1925 to £770,614 in 1926. Before 1917 there were 7 British railway companies in Uruguay, but during that year the government purchased the Uruguay East Coast Railway. During the same period the mileage has remained constant. There are 1314 miles of track in operation. The dividends paid during the year were at the same rate as for the fiscal year, June 30, 1925, 6.1 per cent. One of the subsidies under which the railways were operating expired, and others are due to be terminated in the near future. In spite of that fact, the North Western of Uruguay Railway, which was the road to suffer a deficit in its subsidy, showed an increase of over £12,000 in its net revenue. The Pan American Union reported in August that the national administration council had authorized the director of the state railways and tramways to contract for the electrification of the railroad from Belveder to Santiago Vázquez.

**GOVERNMENT.** Under the constitution as amended Jan. 3, 1918, legislative power is vested in a parliament of two houses, the chamber of representatives elected by universal suffrage of males over 18 years of age, and the senate chosen by an electoral college which is elected by popular vote. Executive power is vested in the president, elected by direct popular vote, and a national administrative council of nine members. President in 1926, José Serrato (elected for the term Mar. 1, 1923-Feb. 28, 1927); president of the administrative council, Luis Alberto de Herrera.

**HISTORY.** A national election was held in Uruguay on November 28 to select a successor to President Serrato, who was to retire from office Feb. 28, 1927. The successful candidate was Dr. Juan Campistegui, a member of the "Colorado" party. Dr. Campistegui, a journalist by profession (the founder of the newspaper *El Día*), had seen considerable service in the government of the republic, at one time serving as secretary of the treasury and at another as minister of the interior.

On November 16 diplomatic relations between Cuba and Uruguay were severed by the former country because of the statement made by the Uruguayan delegate to the League of Nations that the sovereignty of Cuba was restricted by the permanent treaty between Cuba and the United States. At the time no notice was taken of the incident, but the publishing of articles in many South American newspapers led Cuba to take action. The incident was shortly closed when the Uruguayan government stated that the articles were in no way official and were written by a person not connected with the government, although they purported to have been the work of Señor Guani, the Uruguayan representative to the League of Nations.

On September 13 the Chamber of Deputies ratified an extradition treaty with Brazil and an arbitration treaty with Salvador. On the same day, the treaty of obligatory arbitration with Spain was ratified. This treaty replaced the treaty of Nov. 21, 1902. The new treaty eliminates the exception contained in the old treaty that questions affecting constitutional principles of either of the signatory nations would not be subject to arbitration.

**UTAH. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 449,396. The estimated population on July 1, 1926, was 514,000. The capital is Salt Lake City.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	562,000	1,722,000 *	\$13,776,000
	1925	568,000	1,874,000 *	16,866,000
Wheat, winter	1926	149,000	3,129,000	3,348,000
	1925	145,000	3,190,000	4,147,000
Wheat, spring	1926	88,000	2,376,000	2,424,000
	1925	88,000	2,904,000	3,746,000
Potatoes	1926	17,000	2,465,000	2,588,000
	1925	15,000	2,400,000	3,192,000
Oats	1926	57,000	2,280,000	1,868,000
	1925	60,000	2,820,000	1,748,000

\* tons.

**MINERAL PRODUCTION.** The State led in 1925 in silver production in the United States, and was one of the leading producers of lead and copper. From production of gold, silver, copper, lead, and zinc it derived much the greatest part of the total value of its yearly mineral production, coal supplying most of the remainder. The five metals were produced to a total value in 1925 of \$82,701,394, and in 1924 of \$66,227,637. Copper, the leading metal in point of value of production in the State, was produced to the quantity of 236,486,540 pounds in 1925 as against 242,138,165 in 1924. Lead production rose to 306,669,824 pounds in 1925, from 233,910,875 in 1924. The production of zinc rose to 52,611,732 pounds in 1925, from 18,562,172 in 1924. That of silver was 21,276,689 fine ounces in 1925, as against 17,253,692 in 1924. Gold produced totaled 177,803 fine ounces in 1925 and in 1924, 146,486. Of coal there were produced 4,630,000 short tons in 1925, and 4,488,157 in 1924; the product for 1924 was valued at \$12,057,000. Among the other mineral products were asphalt, salt, iron ore, arsenious oxide, and gypsum. The total value of the State's mineral product, duplications excluded, was, in 1924, \$84,356,626; in 1923, \$86,221,000.

The mines of Utah in 1926 produced gold, silver, copper, lead, and zinc valued at \$81,971,000, a decrease of about \$730,000 from the output of 1925, according to estimates of the U. S. Bureau of Mines. Production of both copper and zinc surpassed that of any past year. The silver and lead, though large in quantity, were somewhat less than in 1925, and the gold output was slightly increased. The average prices paid for silver, copper, lead, and zinc decreased slightly, but the increased value of the zinc output was about equal to the decreased value of the silver production. Utah was first in the United States in the production of silver, second in lead, and third in copper. Decided progress was made in custom milling operations at International, Midvale, and Bauer. The gold production increased to about \$3,721,000. The silver output decreased to 19,186,000 ounces, but the production exceeded any year's except 1925. The value of the silver output decreased to \$11,972,000, or about 19 per cent, owing in part to the decrease in the average price. The production of copper increased to 255,540,000 pounds, and the value to \$35,265,000. The lead output decreased to 292,184,000 pounds. The value decreased to \$24,251,000, and the average price from 8.7 cents to about 8.3 cents a pound.

The zinc recovered from ore and concentrate leached or smelted increased to about 92,000,000 pounds, and the value to \$6,762,000.

**FINANCE.** As summarized by the U. S. Department of Commerce, payments for the maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$7,011,204. Their rate per capita was \$15.48, as against \$13.92 in 1924 and \$8.41 in 1917. Their total included \$3,475,591 for education, apportioned among the minor State divisions. Payments amounting to \$468,089 for interest on debt and \$2,501,597 for permanent improvements, added to the payments for maintenance and operation of departments, made the total of the year's State payments \$10,580,890. For highways was expended the sum of \$3,152,849, of which \$827,982 was for maintenance and \$2,324,867 for construction.

Revenue receipts of the State were \$10,811,835, or \$21.98 per capita. They exceeded by \$2,732,542 the total payments except those for permanent improvements, and, furthermore, exceeded by \$230,945 the total with these included. Excess receipts were applied to debt reduction. Property and special taxes formed 48.7 per cent of the revenue in 1925, as against 53.3 per cent in 1924 and 59.5 per cent in 1917. Their per capita rate was \$10.70 in 1925, \$12.08 in 1924 and \$5.76 in 1917. Earnings of the departments and compensation for officials' services furnished 6.3 per cent of the 1925 revenue; business and non-business licenses, 15.4 per cent. License receipts were derived chiefly from taxes on incorporated companies, on sales of gasoline, and on motor vehicles. The net indebtedness of the State on June 30, 1925, was \$7,843,250, or \$15.95 per capita, as against \$16.73 in 1924 and \$6.32 in 1917. The assessed valuation of property subject to State tax was \$665,451,862. The State tax levy was \$4,894,343, or \$9.95 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 2189. There were constructed in 1926, of new track, 6 miles of first and 26 miles of second track.

**EDUCATION.** The leading event in educational

progress in the State, according to C. N. Jensen, State superintendent of public instruction, was the state school survey. This survey included the institutions of higher learning as well as the schools. It was undertaken by a body of 16 experts in elementary, secondary or higher education, with John J. Tigert, U. S. commissioner of education, at the head. Under the system put in force in 1926 in accordance with a law of the previous legislature, none but holders of valid certificates issued by the State board of education might legally teach in the public schools. The requirement for those beginning to teach was made to include completion of a standard two-year normal-school course.

As reported by the State department of public instruction at the end of 1926, the school population of the State was 143,054. Students enrolled in public schools numbered 136,671; of these 110,695 were in elementary grades and 25,976 in high-school grades. Expenditure for public school education in the State in the scholastic year 1925-26 attained \$10,587,132. Salaries of teachers and principals averaged \$1222.

**CHARITIES AND CORRECTIONS.** Chief among the charitable and correctional institutions of the State in 1926 were the State prison, industrial school, hospital, and school for the deaf and blind.

**POLITICAL AND OTHER EVENTS.** At the election, November 2, Senator Reed Smoot, Republican, was reelected to the U. S. Senate, for the six-year term. He defeated his Democratic opponent, Ashby Snow, by a majority of approximately 34,000. The State's two members of the U. S. House of Representatives, both Republican, were reelected. Elias Hansen was elected an associate justice of the State supreme court to succeed Valentine Gideon.

The Utah Wool Marketing Association announced in April that it had completed plans for the cooperative marketing of wool for the ranchers. Native miners employed in the Judge coal mine at Park City became involved in racial troubles with Mexicans there employed, with the result of a fatal affray and a walkout of the native miners, March 21.

**OFFICERS.** Governor, George H. Dern; Secretary of State, H. E. Crockett; Treasurer, John Walker; Auditor, John F. Holden; Attorney-General, Harvey H. Cluff; Superintendent of Public Instruction, C. N. Jensen.

**JUDICIARY.** Supreme Court, Chief Justice, Samuel R. Thurman; Associate Justices, J. E. Frick, James W. Cherry, N. D. Straup, Valentine Gideon.

**UTAH, UNIVERSITY OF.** A State institution of higher education at Salt Lake City, founded in 1850. The resident enrollment for the fall term of 1926 was 2726, and for the summer session of the same year, 893. The faculty numbered 167, exclusive of 12 on leave of absence studying at other institutions. The productive funds of the university amounted to \$426,154, and the income for 1925-26 was \$748,035.56. The library contained 87,800 volumes and 23,931 pamphlets. President, George Thomas, Ph.D.

**VACCINATION.** See SMALL POX AND VACCINATION.

**VAHID-ED-DIN, EFFENDI.** Former Sultan of Turkey. See MOHAMMED VI.

**VALENTINO, RUDOLPH.** American motion picture actor, died in New York, August 23. He was born at Castellana, Italy, in May, 1895,

and was christened Rodolpho Alfonzo Rafaelo Pierre Filibert Guglielmo di Valentina d'Antonguolla. After graduation from the Royal Academy of Agriculture, he visited Paris and Monte Carlo. His travels and mode of living had left him penniless. He arrived in New York in November, 1913, and was employed as garden overseer on a Long Island estate, later becoming an apprentice gardener in Central Park, New York City, but he also served in menial capacities. He gave much time to the development of his dancing ability, at this time being known as Guglielmi. Succeeding as a professional dancer, he joined a traveling theatrical troupe, working out to California. After serving as a supernumerary in Hollywood, he became Valentino. His success as Julio in *The Four Horsemen of the Apocalypse* was followed by parts in *The Conquering Power* and Nazimova's *Camille*. He played with Gloria Swanson in *Beyond the Rocks*, and followed this with *The Young Rajah*, *Blood and Sand*, *Monsieur Beaucaire* and *The Sainted Devil*. All his previous triumphs, however, were eclipsed by *The Sheik*. Valentino later produced *The Eagle*, but this had not such drawing power as his *Sheik*. His last picture was called *The Son of the Sheik*. It was while visiting New York for the premiere of this picture that Valentino was taken suddenly ill and, after an operation, died.

**VALERA Y DELAVAT, LUIS, MARQUÉS DE VILLASINDA.** A Spanish diplomat and author, died July 1, in Rome. He was born in 1870, the son of a distinguished diplomat and statesman, Juan Valera y Alcalá Galiano, who was the most Attic stylist produced by Spain in the nineteenth century and one of its foremost novelists. He continued in a dignified manner two of the phases of the life of his illustrious father, diplomacy and belles lettres. His first diplomatic post was that of secretary of the Spanish Legation at Peking. He took advantage of his Oriental experience to obtain material for his creative writings, and based his first two works, *Sombras Chinescas* (in two volumes), and *Visto y Sonado*, on his residence in the Far East. Later he served as Minister to Morocco and to Portugal. During the World War, and just before the collapse of Russia, he was sent as Ambassador to Petrograd. His last post was that of Spanish Ambassador to the Vatican, a very delicate mission, despite Spain's fidelity to the Church. Among his writings the following may be mentioned: *Del Antaño Quimérico* (short stories), *Un Alma de Dios* (a novel), *El Filósofo y la Tiple* (a novel), and *De la muerte al amor* (a novel).

**VALLEY FORGE.** See CELEBRATIONS.

**VANADIUM.** In 1926 it was estimated that the world's output of vanadium ores and their consumption in the aggregate was equivalent to 1,500,000 pounds of vanadium. A roscoelite-bearing sandstone from East Rifle Creek, Colo., was furnishing an ore exceptionally free from impurities, from which both fused oxide and ferro-vanadium were being made. In Utah vanadium ore in Southeastern Utah was being mined and worked. That there was a market for such material in the United States was indicated by the fact that the country imported vanadium ores aggregating 7471 tons, with a value of \$914,114, of which the greater part came from Peru. In Northern Rhodesia, various vanadium ores were being produced, and new deposits were being worked in Mexico. Vanadium was being used

in steels other than tool steels by simple processes, so that a product was obtained equal or superior to elaborately made and treated steels which did not contain vanadium.

**VANDERBILT UNIVERSITY.** A non-sectarian, coeducational institution of the higher learning at Nashville, Tenn.; founded in 1873. In 1925 the total number of students was 1424. In the autumn of 1926, it was 1238, the decrease being partly due to the discontinuance of the dental school. The enrollment was distributed as follows: College of arts and sciences, 697 undergraduates and 64 graduate students; school of engineering, 114; school of law, 134; school of religion, 47; school of medicine, 182. The faculty, exclusive of administrative officers, librarians, assistants, etc., numbered 153. The productive funds of the university amounted to \$9,000,000, the annual income was about \$700,000, and the value of the University's property was estimated at approximately \$5,300,000. The library contained 84,000 volumes. Chancellor, James H. Kirkland, PhD., LL.D., D.C.L.

**VASSAR COLLEGE.** A non-sectarian institution for the higher education of women at Poughkeepsie, N. Y.; founded in 1861. The enrollment for the autumn of 1926 was 1147. In 1926-27 the teaching faculty had 150 members, an increase of 13 over 1925-26. The endowment, including fellowships and scholarships, amounted to \$6,582,873 and the income for the year to \$361,338. There were 143,000 volumes in the library. President, Henry Noble MacCracken, Ph.D., L.H.D., LL.D.

**VATICAN.** See ROMAN CATHOLIC CHURCH.

**VEGETABLES.** See HORTICULTURE.

**VENEZUELA**, ven'ê-zwê'lâ, *Sp. pron.* vâ'nâ-thwâ'lâ or *Amer. Sp. pron.* vâ'nâ-swâ'lâ. A republic on the northern coast of South America, bordering on the Caribbean Sea and lying between Colombia on the west, Brazil on the south and British Guiana on the east. Capital, Carâcas.

**AREA AND POPULATION.** Venezuela has an area of 393,874 square miles; population, according to the census of December, 1920, 2,411,952; estimated, Dec. 31, 1924, 2,563,334. The population of Carâcas in 1920 was 92,212, and of other large cities: Maracaibo, 46,706; Valencia, 29,466; Barquisimeto, 23,943; and San Cristobal, 21,385. Because of the tremendous activity in the oil fields around Maracaibo, the population of the city has grown by leaps, and was estimated at 100,000 in 1926. Immigrants in 1924 numbered 13,070, and emigrants, 11,170.

**EDUCATION.** Elementary education is free and compulsory after the age of 7 to the completion of the primary grade. According to the report made by the minister of public instruction to the national congress, the registration and the average attendance in the various types of schools during 1925 were as follows:

	Registration Attendance	
Federal schools of primary instruction	47,507	34,442
Primary schools, private, municipal, and state	32,058	No data
Federal institutions of		
Higher learning	340	281
Secondary education	524	456
Special instruction	2,164	1,042

**PRODUCTION.** The area of Venezuela falls naturally into three zones, the agricultural, the pastoral, and the forest. In the first are grown coffee, cacao, sugar-cane, cotton, beans, etc. Naturally,

the second is devoted entirely to livestock. In the third, tropical products are found, such as caoutchouc, balata (a gum resembling rubber), vanilla, tonka beans, copaiba, etc. The area under coffee has been estimated at 180,000 to 200,000 acres, and the annual output of sugar at 60,000 tons. The country is rich in minerals, gold, silver, copper, coal, and salt being mined on a large commercial scale. Venezuela is one of the richest oil countries in the world, and promises to become one of the largest producers. The total production for the first eight months of 1926 reached 22,333,726 barrels, compared with 19,770,091 for the whole of 1925. The total Venezuelan production prior to 1925 amounted to 17,789,403 barrels. Production in the Concepción and La Paz fields began in 1925, and the output of all others greatly increased, with the exception of Mene Grande.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, 1925 was an exceptionally good year, the foreign trade exceeding by 33 per cent the figures for the prosperous year 1924. The total trade for 1925 was \$121,918,460, a gain of \$39,301,323 over 1924.

Imports for 1925 totaled \$58,426,648, a gain of \$16,882,743 over the previous year. Nearly 10 per cent of this business was done by parcel post. The United States continued to lead in the supply of goods to Venezuela; the total value of its sales in 1925, amounting to \$31,419,610, represented a gain of \$8,326,123 over the previous year. The United Kingdom was next, furnishing goods to the value of \$11,046,665, as compared with \$7,788,194 in 1924. Germany increased the value of its sales, from \$2,897,568 in 1924 to \$4,831,884 in 1925, as did France from \$2,179,856 in 1924 to \$2,943,641 in 1925.

The total exports of the country for the year 1925 amounted to \$63,491,809, a gain over 1924 of \$22,417,020. The United States, as usual, was a good customer of Venezuela, taking exports to the value of \$10,414,197, as compared with \$6,332,564 for 1924, a gain of nearly 65 per cent. Of the Venezuelan exports, crude petroleum to the value of \$5,633,340 was shipped by an American company to its terminal on the Dutch Island of Aruba, just off the north coast of Venezuela. This petroleum was later trans-shipped to the United States.

It was believed that the foreign trade of Venezuela for the year 1926 would materially exceed that of 1925.

**FINANCE.** The following table gives the main items of revenue and expenditure for the budget of 1925-26:

	Revenues	Bolivars
Customs	.....	27,400,000
Land taxes	.....	4,000,000
Cigarette revenue	.....	9,000,000
Stamp duty	.....	6,600,000
Salt revenue	.....	6,500,000
Mines	.....	4,000,000
Total (all items)	.....	69,147,500
	Expenditure	Bolivars
Department of Interior	.....	12,592,234
Department of Foreign Affairs	.....	3,004,472
Department of Finance	.....	16,718,717
Ministry of War and Marine	.....	13,008,640
Department of Internal Development	.....	6,760,883
Ministry of Public Works	.....	8,296,680
Ministry of Education	.....	5,242,493
Unforeseen expenditure	.....	656,281
Total	.....	66,280,350

'According to the President's annual message, the national debt, as of Jan. 1, 1926, was 92,-426,936 bolívares, of which 38,287,879 bolívares represented internal debt and 54,139,057 bolívares foreign debt. On Mar. 31, 1926, reserve funds in the national treasury amounted to 82,506,531 bolívares, after all obligations had been met.

**COMMUNICATIONS.** The latest available statistics for shipping are those for 1923, when 1258 vessels, of 1,534,261 tons, entered, and 2570, of 1,603,360 tons, cleared. In August, 1926, the Pan American Union reported that there were 1193 kilometers (approximately 740 miles) of railway in Venezuela, including the roads used in mining operations and on sugar plantations, as well as electric-car companies. The average cost per kilometer of all the railroads of Venezuela has been estimated at 226,165 bolívares, but it actually varied from 73,500 bolívares, the cost of the Carenero Railroad which runs through tableland, to 640,000 bolívares, the cost of each of the 32 kilometers of the Great Venezuelan Railroad constructed through the mountains.

**GOVERNMENT AND HISTORY.** According to the constitution of June 24, 1925, the executive power is vested in the president, who acts through a responsible ministry, and who is elected by congress for 7 years; and the legislative power is vested in the congress, consisting of a senate and a chamber of deputies, the former of 40 members (two from each state) elected for three years, and the latter of one deputy for every 35,000 inhabitants and one more for an excess of 15,000, also elected for three years. President of the republic during 1926, Gen. Juan Vicente Gómez (elected May 3, 1922, for the period 1922-29).

On April 26, Dr. Carlos F. Grisanti was received by President Coolidge as the envoy extraordinary and minister plenipotentiary of Venezuela in the United States. Dr. Grisanti is one of the leading members of the Venezuelan bar, and had served as diplomatic agent to France and The Netherlands. He succeeded Dr. Pedro M. Arsaya.

As November, 1926, marked the hundredth anniversary of the birth of Aristides Rojas, a distinguished Venezuelan historian, who devoted his life to patriotic service and letters, the government ordered all his scattered works, many of which are scarcely known, compiled and edited at public expense, under the direction of Sr. José E. Machado.

**VERMONT. POPULATION.** According to the Fourteenth Census the population of the State on Jan. 1, 1920, was 352,428. No essential change was made in these figures by later estimates. The capital is Montpelier.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	926,000	1,461,000 *	\$21,184,000
	1925	924,000	1,449,000 *	19,127,000
Corn	1926	84,000	3,948,000	3,751,000
	1925	85,000	4,080,000	4,080,000
Potatoes	1926	20,000	8,100,000	4,840,000
	1925	19,000	2,875,000	5,106,000
Oats	1926	82,000	8,116,000	1,870,000
	1925	84,000	8,860,000	1,982,000

\* tons.

**MINERAL PRODUCTION.** Stone and slate furnish the chief part of the total value of the yearly

production of minerals. Of stone there were produced 295,880 short tons in 1924, a decline in quantity from the production of 1923, 342,520 short tons; but the value of the product in 1924, \$9,066,073, exceeded that in 1923, \$8,661,906. Slate to the value of \$3,940,154 was sold by the State's producers in 1925, and in 1924, \$4,010,346. The State ranked second as a slate producer. Of lime were produced 69,000 short tons in 1925 and 56,484 in 1924; in value, \$741,000 (estimated) in 1925 and in 1924, \$710,739. Tale production was 61,653 short tons in 1924 and 67,100 in 1923; in value, \$573,747 in 1924 and in 1923, \$533,510. The total value of the State's mineral product in 1924 was \$14,549,429; in 1923, \$13,910,449.

**FINANCE.** As summarized by the U. S. Department of Commerce, payments for the maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$4,936,224. Their per capita rate was \$14.01, as against \$12.57 in 1924 and \$9.36 in 1918. Their total included \$408,318 for education, apportioned among the minor State divisions. Payments amounting to \$92,930 for interest on debt and \$1,792,821 for permanent improvements, added to payments for the maintenance and operation of State departments, made the year's total of State payments \$6,821,435. For highways was expended the sum of \$3,218,097, of which \$1,764,477 was for maintenance and \$1,451,620 for construction.

Revenue receipts of the State were \$6,788,261, or \$19.26 per capita. They exceeded by \$1,759,647 the total payments except those for permanent improvements, and were \$33,174 less than the total with these included. Property and special taxes formed 43.9 per cent of the revenue in 1925, as against 49.4 per cent in 1924 and 67.7 per cent in 1918. Their per capita rate was \$8.46 in 1925, \$8.69 in 1924 and \$7.25 in 1918. Earnings of the departments and compensation for officials' services furnished 8.5 per cent of the 1925 revenue; business and non-business licenses, 31.7 per cent. License receipts included those from taxes on incorporated companies, on gasoline sales and on motor vehicles and inheritance taxes. The net indebtedness of the State on June 30, 1925, was \$1,842,532, or \$5.23 per capita, as against \$5.49 per capita in 1924 and \$2.22 in 1918. The assessed valuation of property subject to State tax was \$317,346,427. The State tax levy, including direct State taxes for roads and schools, was \$1,533,577, or \$4.35 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 1057. No new construction and no abandonments of line were reported in 1926.

**EDUCATION.** The State commissioner of education, Clarence H. Dempsey, noted a substantial gain during the year in the number of normal-school students, and likewise in the number of those completing the two-year normal course. There was activity in the standardization of the rural schools. For the year ending June 30, 1926, the school population of the State was placed at 75,772 persons between the ages of 6 and 18 years. The total public-school enrollment in that year was 64,046, of which the common-school enrollment furnished 53,551 and that in high schools 10,495. Expenditure for public education in the State amounted for the year to \$4,742,381.

**CHARITIES AND CORRECTIONS.** The Department

of Public Welfare, instituted in 1923, William H. Dyer, commissioner, controlled in 1926 the following institutions, with the populations indicated: Vermont State hospital, at Waterbury, 858; industrial school, Vergennes, 240; school for feeble-minded, Brandon, 234; sanatorium, Pittsford, 60; State prison and house of correction for men, Windsor, 345; State prison and house of correction for women, Rutland, 27; Kinstead receiving home for children, Montpelier, 20.

**POLITICAL AND OTHER EVENTS.** At the general election, November 2, John E. Weeks, Republican, of Middlebury, was elected Governor for the two-year term beginning January, 1927, defeating the Democratic candidate, Herbert C. Comings, although for the first time in decades the Democratic candidate carried three of the counties, Chittenden, in which Burlington is situated, Franklin, and Grand Isle. Senator Porter H. Dale, Republican, was reelected to the U. S. Senate, defeating James E. Kennedy, Democrat, and the State's two members of the U. S. House of Representatives, both Republicans, were reelected. Other officers elected in November, to take office in 1927, were: Lieutenant-Governor, S. Hollister Jackson; Treasurer, Thomas H. Cave; Secretary of State, Aaron H. Grout; Auditor, Benjamin Gates; Attorney-General, J. Ward Carver.

The New England Conference, holding successive sessions in different States, met at Burlington, June 12, to discuss measures for the betterment of industry and agriculture in the New England region. The State forestry department made intensive efforts to prevent pine-tree infestation by blister rust. Eradication of over 257,000 gooseberry and currant bushes on 22,650 acres of land was effected. The work was performed at owners' expense, but overseen by trained State foremen. A traffic survey of the highways in the State made in the summer and autumn formed the basis of a recommendation of the State highway board, published in December, for the construction of 316 miles of hard-surface roads.

**OFFICERS.** Governor, Franklin S. Billings; Lieutenant-Governor, Walter K. Farnsworth; Secretary of State, Aaron H. Grout; Treasurer, Thomas H. Cave; Auditor, Benjamin Gates; Attorney-General, J. Ward Carver in place of Frank C. Archibald, resigned; Commissioner of Education, C. H. Dempsey.

**JUDICIARY.** Supreme Court: Chief Justice, John H. Watson; Associate Justices, George M. Powers, William H. Taylor (died in 1926), Leighton P. Slack, Fred M. Butler (resigned in 1926), and Frank L. Fish and Sherman R. Moulton (both promoted from the Superior Court bench in 1926).

**VERMONT, UNIVERSITY OF.** A State institution of higher education at Burlington, Vt.; founded in 1791. The 1926 fall enrollment was 1276, of whom 710 were men and 566 women. This number was distributed as follows: Arts and sciences, 787; medicine, 107; engineering, 161; agriculture, 107; graduate students, 5; two-year State teacher-training course, 109. There were 150 members on the faculty. The endowment amounted to approximately \$1,500,000, and the income for the year to \$817,000. The library contained 120,000 volumes. During the year the Ira Allen Chapel, the gift of James B. Wilbur, was erected at a cost of \$250,000. President, Guy W. Bailey, LL.D.

**VERRILL, ADDISON EMERY.** American zoologist and geologist, died December 10. He was born at Greenwood, Me., Feb. 9, 1839, and graduated from Harvard University in 1862. From 1860 to 1864, he was assistant in the Museum of Comparative Zoölogy at Yale University, and from 1864 to 1907 he was professor of zoölogy becoming emeritus professor in the last-named year. Also he was curator of the Zoölogical Museum, and from 1870 to 1894 he was instructor in zoölogy in the Sheffield Scientific School. For the ten years 1864-74 he was Curator of the Boston Society of Natural History, and from 1868 to 1870 he was professor of comparative anatomy and entomology in the University of Wisconsin. For the period 1869 to 1920 he was associate editor of the *American Journal of Science*. He was a member of the National Academy of Science. Dr. Verrill was assistant in charge of scientific exploration for the United States Fish Commission for the period 1871 to 1887, and made valuable original investigations in relation to the invertebrata of the entire Atlantic and Pacific coasts of North America, with especial reference to deep sea fauna. He was the author of more than 350 papers on zoölogical and geological subjects.

**VESSELS, NAVAL, AND NAVAL AVIATION.** No designs of new vessels in any of the established classes of warships embodied notable variations from existing models. Exact information, however, concerning some of the new cruisers and submarines building abroad is often withheld until the vessels are very far advanced in construction. The French suggestion of a cruiser-destroyer of about 17,500 tons was still under discussion, but the approval of the design was not strong enough to render the construction of such a vessel probable in the near future. Some information in regard to new vessels of the various types is given in the following notes:

**AIRCRAFT CARRIERS.** The large aircraft carriers which were building for the United States and Japanese navies were approaching completion and were to be in service before the end of 1927. The Japanese *Akagi* and *Kaga* have about the same displacement, 26,900 tons; but the speed of the *Akagi* (reported as 28 knots) was expected to exceed that of the *Kaga*. The United States carriers, *Saratoga* and *Lexington*, of 33,000 tons, were to have a speed of 33 knots or more. The French carrier *Béarn* (ex-battleship), of 21,450 tons and 21.5 knots speed and the British carriers *Courageous* and *Glorious* (ex-cruisers) were also to be completed in 1927. Japan had begun the transformation of a 15,000-ton tanker into a carrier—a rather remarkable procedure, unless she was very fast for her class.

**BATTLESHIPS.** The only battleships building were the *Nelson* and *Rodney* for the British navy. The principal details were: Length over all, 702 feet; beam, 106 feet; normal draft, 30 feet; standard displacement, 35,000 tons; armament, nine 16-inch guns in three turrets on the centre line, all forward of the foremast and bridge houses, the middle turret high enough to permit firing over the others, twelve 6-inch guns in 6 turrets; numerous anti-aircraft guns; armor (probable), turrets, 13 inches, belt, 12 inches, heavy deck protection against aerial bombs and plunging fire. The grouping of the guns on the forward deck permitted heavy deck armor around them and thick armor on the sides abreast the

loading trunk. The full load displacement of these ships was to exceed 40,000 tons.

**CRUISERS.** France, Great Britain, Italy, Japan, Spain, and Australia were building 10,000-ton light cruisers, the largest that could be built under the terms of the Washington treaty. Some of the lesser powers had such vessels under consideration. The two French cruisers which were most nearly completed were the *Duquesne* and the *Tourville*. They were of 10,000 standard tons, but the displacement, with all fuel and reserve water tanks full, was to be over 11,500 tons. The length over all was 626 feet; beam, 63 feet; draught, 20 feet. Four sets of turbines and 8 small-tube boilers were expected to develop 120,000 b.h.p., and give a speed of 34 knots. The fuel-oil supply was 1200 tons, designed to give a radius of action of 1200 miles at 30 knots and 5500 miles at 15 knots. The armament was to consist of eight 8-inch guns in pairs in turrets on the midship line, 2 forward, 2 aft—the second and fourth turrets firing over the first and third, respectively; eight 3-inch and eight 1-pounder automatic guns, forming the anti-aircraft battery; and twelve 3-tube deck mountings for 21.7-inch torpedoes. Two airplanes were to be carried, and launched by a catapult.

The Italian cruisers *Trento* and *Trieste*, of 10,000 tons, had a length of 640.7 feet on the water line; the beam was 67.5 feet; the mean draught, 18.9 feet. The armament consisted of eight 50-cal. 8-inch guns mounted like those of the *Duquesne*; twelve 4-inch anti-aircraft guns; and 8 torpedo tubes in twin deck-mounts. The mounts of the anti-aircraft guns permitted their use for horizontal fire also. The designed speed was 35 knots. Two airplanes were to be carried, and launched by a catapult. Four cruisers of the *Myoko* class of 10,000 tons were building in Japan. Satisfactory descriptions of these vessels were not available. The Japanese press stated that they were to have a speed of 35.5 knots, carry twelve 8-inch guns, have armor deck protection against aerial bombs and a 5-inch armor belt, and be able to steam 1400 miles at moderate speed. These characteristics as a whole are very improbable; some may have been correct.

**DESTROYERS.** The size of these vessels is constantly increasing. The new French boats bearing this title were of about 2700 tons and were really small cruisers or large flotilla leaders.

**SUBMARINES.** In the new French budget, another 3000-ton submarine cruiser was authorized. The Japanese were credited by rumor with having under construction one boat or more, equally large. Of this there was considerable doubt.

**NAVAL AVIATION.** The United States Navy still led the navies of the world in naval aviation. (See NAVAL PROGRESS: *Navies of the World in 1926*—United States.) Great Britain is a bad second; Japan, third; Italy, fourth; France, fifth. Following the publication of the Morrow Board report, Congress authorized a very extensive plan of development which included, in addition to airplanes, the construction of two airships of 6,500,000 cubic feet capacity. The commencement of neither of these ships was provided for in the budget submitted to Congress in December, 1926. (For a detailed account of the condition of the aviation in each navy, see the note in regard to that navy under the head of NAVAL PROGRESS.) The condition of aviation in the British navy is given in the YEAB BOOK for 1925, p. 473. There had been very little change

since. British fighting ships of all classes carry no catapults and few planes. Without catapults, planes have to be lowered into the water before they can "take off." This is slow work, and impossible in a rough sea. See NAVAL PROGRESS.

**VETERANS' BUREAU.** See UNITED STATES.

**VETERINARY MEDICINE.** The year 1926 was made notable by the removal of all quarantine restrictions placed as a result of the outbreak of foot-and-mouth disease, and by the progress in eradication work with bovine tuberculosis and the cattle tick. It was marked by the loss from hog cholera, for seldom has the American farmer suffered heavier losses from this disease than in the fall of 1926.

**BOVINE TUBERCULOSIS ERADICATION.** The active, nation-wide campaign to eradicate tuberculosis from livestock continued with gratifying results. There was a large increase in the county-wide testing of cattle, and up to July 1, 1926, 109 counties, or a total of 198, had completed tuberculin testing of their cattle and were listed as modified accredited areas. This large area virtually freed of tuberculosis in cattle, as pointed out by the chief of the Federal Bureau of Animal Industry, is convincing evidence that eradicating the disease from the entire country is possible. A survey of the extent of tuberculosis May 1 revealed that the average infection among cattle was about 2.8 per cent, as compared with approximately 4 per cent in 1922. The work was carried on under the appropriation of \$3,560,000, of which \$982,000 was allotted for operating expenses and \$2,578,000 for indemnifying owners of condemned cattle, or an increase of about \$150,000 for indemnity purposes over the preceding year. The State appropriations were approximately \$10,000,000. There was an average of 211 regular veterinarians employed by the Federal Government and 267 by State livestock sanitary officials and municipalities, with a total of 768 veterinarians so engaged throughout the year.

At the conclusion of the fiscal year ended June 30 there were listed as fully accredited 96,392 herds, containing 1,577,087 cattle, an increase of 24,009 herds, containing 302,024 cattle. In addition, 1,304,432 herds, containing 10,658,259 cattle, passed one test in the process of becoming accredited. This was an increase of 382,674 herds and 2,610,719 cattle. The total herds and cattle under supervision at the end of the fiscal year numbered, respectively, 1,556,366 and 15,131,345; and on the waiting list there were 434,636 herds, containing more than 3,994,192 cattle. In connection with this and the area eradication work, the tuberculin test was applied to 774,728 herds, containing 8,650,780 cattle, of which 323,084 cattle, or 3.7 per cent, were condemned as diseased. During the fiscal year 1926, accredited veterinarians under this plan tested 43,921 herds, containing more than 788,995 cattle, an increase of 34 per cent over the preceding year. In connection with the testing, a survey was made in which it was found that 1249 cities in 47 States (1 State missing) have municipal ordinances requiring tuberculin testing of the cattle furnishing milk to their communities. Much progress was made in the eradication of tuberculosis from swine and fowls.

**FOOT-AND-MOUTH DISEASE.** The outbreaks of foot-and-mouth disease in California and Texas which occurred in 1924 and recurred in 1925, and were the cause of great anxiety, were successfully eradicated, and on June 10, 1926, the

quarantine restrictions were withdrawn. The final suppression of the disease, especially in the rough mountain ranges of California, where wild deer as well as cattle were infected, removed one of the most serious dangers that ever threatened the livestock industry. The appearance of the disease in Mexico in the summer caused a renewed vigilance, but no immediate danger. Outbreaks continued to occur in Great Britain, 109 involving 27 shires, and resulting in the slaughter of 5316 cattle, 11,007 sheep, 2237 pigs, and 7 goats, having been recorded up to November.

**CATTLE-TICK ERADICATION.** Good progress was made in eradication work with the cattle tick, the activities resulting in the release of 18 counties and parts of 9 counties in 5 States up to the close of the fiscal year on June 30. The removal of the quarantine from the last 7 counties in North Carolina on Dec. 10, 1925, marked the release of the entire State from the Federal quarantine. The work was continued under the direction of 9 field stations, which at the close of the fiscal year had a total field force of 270 veterinarians and other employees working in cooperation with 304 State inspectors and 390 county employees. Under the supervision of the cooperating forces, 16,683,285 inspections or dippings of cattle were conducted; more than 16,000 dipping vats were used in these official dippings.

**DOURINE ERADICATION.** In Montana, where no outbreaks of dourine had occurred since 1922, a small centre of infection was discovered; 17 animals reacted to the blood test and were destroyed. In Arizona, the only other State in which the disease was found, infection was confined entirely to Indian reservations, where for lack of funds little if any progress was made, the number of reactors being greater than in the preceding year.

**HOG CHOLERA.** Following a period of years when the outbreaks of hog cholera had reached a low ebb, the floods were released and the losses that took place in the fall of 1926 were colossal. Fertilizer factories in corn-belt communities became glutted with the raw material and were unable to handle the carcasses. The demand for anti-hog-cholera serum caused such a shortage that the U. S. Department of Agriculture removed the three weeks' testing requirement, and thus made some 35,000,000 cc. of protective serum available for immediate use, or sufficient to treat 700,000 hogs.

**SCABIES ERADICATION.** In continuation of the eradication work with sheep scabies, 23,391,576 inspections were made in the field, and 3,176,285 dippings of sheep were supervised. Upon inspection, 969,925 sheep were found to be infected, or approximately 18 per cent less than during the preceding year. Inspection reports indicated greater prevalence of the disease in Kansas, Nebraska, and Wyoming, but in a number of other States, especially Arizona, California, New Mexico, and Texas, infection was less extensive than during the preceding year. No infection was found in Idaho, Montana, or Nevada. In eradication work with cattle scabies, 3,269,851 inspections were made, and 1,545,292 dippings were supervised. Upon inspection, 308,787 cattle were found to be infected, an increase over the preceding year in the number of infected animals. In Washington, which had been free from the disease for a number of years, a small outbreak occurred, traceable to cattle introduced from an-

other State. Increased infection was reported in Colorado, Nebraska, and New Mexico, but in other infected States conditions showed marked improvement.

**CONTAGIOUS ABORTION AND UNDULANT FEVER.** A number of cases were reported by several authors who recorded *Bacterium abortum* of cattle as the cause of undulant fever in man.

**POULTRY DISEASES.** Particular attention was given to the study of bacillary white diarrhea of chicks and to fowl typhoid, due to closely related organisms, and considerable advance was made in the knowledge of them. Independent investigations in New Jersey and California indicated that the causative organism of fowl typhoid might occur in the ovary of the hen and be transmitted through the egg to the offspring, as occurs with bacillary white diarrhea.

**ANIMAL PARASITES AND PARASITICIDES.** In an extensive series of tests of anthelmintics, kamala, which is a drug long used in India for the removal of tapeworms from man and also from dogs and other animals, was found by Hall and Shillinger to be very effective in removing tapeworms from poultry when administered in doses of 1 gm. to each bird. Tetrachlorethylene, a drug developed for the treatment of hookworm infestation, was used rather extensively in the treatment of dogs and is now marketed commercially for that purpose. Preliminary tests of mercurochrome indicate that in repeated doses this drug is very effective in removing whipworms. In investigations by Donham, Simms, and Miller in Oregon, it was found that the so-called salmon poisoning of dogs is caused by a new fluke, which parasitizes salmon. Work with aqueous solution of hyperactive iodine in Michigan showed that it could be used with success in the control of helminth parasites of dogs and foxes. The European gizzard worm parasite of geese, which attacks young birds, was reported as occurring in the United States.

**POISONOUS PLANTS.** Studies in Nevada showed that the common choke cherry is poisonous to sheep and cattle, the leaves containing hydrocyanic acid. In Wyoming two species of delphinium were found to be responsible for cattle losses. The silvery lupine was found to be poisonous to sheep in Wyoming. Molded, spoiled, or damaged sweet clover hay and silage was found in North Dakota to cause a definite hemorrhagic disease of cattle. Nuttall's death camas was found to be the cause of considerable loss of cattle in parts of Oklahoma. The rayless goldenrod was found to produce typical symptoms of alkali disease or milk sickness in cattle, horses, and sheep in the Pecos Valley of Texas and New Mexico.

**VIRUS SERUM CONTROL.** Under the virus-serum-toxin act of 1913, 88 establishments in 60 cities and towns in 20 States operated under license and inspection by the Federal Department of Agriculture, a decrease of 13 from the preceding year.

**VETERINARY EDUCATION.** The number of accredited veterinary colleges remained at 13, the same as in the preceding year. The total student enrollment at veterinary colleges in the United States and 1 in Canada was 582, an increase of 8 over the preceding year, of which 165 entered in the first year. The number graduated was 132, or 11 less than in 1925.

Griffith, *The Dispensatory of the United States of America* (Philadelphia and London, 1926, 21st ed., rev.); W. Yorke and P. A. Maplestone, *The Nematode Parasites of Vertebrates* (London, 1926).

**VICTORIA.** A state of the Australian Commonwealth, situated in the southeastern part of the island continent. Area, 87,884 square miles; population, according to the census of 1921, 1,531,280; estimated March 31, 1926, 1,691,486. Capital, Melbourne, with an estimated population, including suburbs, on Dec. 31, 1924, of 885,700. The other large cities with their populations on that date were Ballarat, 40,600; Geelong, 37,740; Bendigo, 33,640. The movement of population in 1925 was: Births, 35,922; deaths, 15,837; marriages, 13,370; immigration (by sea), 88,467; emigration (by sea), 72,458.

Education is compulsory for children between the ages of 6 and 14. In 1923 there were 2467 government schools, with 6919 teachers, a total enrollment of 253,307 pupils, and an average daily attendance of 167,638. The area and yield of the principal crops in 1925 were: Wheat, 2,705,000 acres, 47,364,000 bushels; oats, 517,000 acres, 9,572,000 bushels; barley, 64,000 acres, 1,445,000 bushels; potatoes, 61,000 acres, 139,000 tons; hay, 1,120,000 acres, 1,493,000 tons; vines, 44,278 acres, 2,177,127 gallons of wine. The wool industry is of great importance. At the end of March, 1925, there were 12,649,898 sheep, and the value of the wool clip in the preceding year was £7,695,000, for 82,513,361 pounds. The mineral resources are abundant, especially coal and gold ores. The output of the former in 1924 was 518,315 tons, valued at £569,555; of the latter, 67,167 fine ounces, valued at £285,316. The value of the total quantity of gold obtained from 1851 to 1924 was estimated at £302,138,996.

In 1924-25 the total value of overseas imports was £40,709,400; exports, £54,304,873. State revenues in 1925-26 amounted to £23,820,402, a decrease of £171,006 as compared with 1924-25. The deficit of the Victorian State government was anticipated to approximate £300,000, of which £200,000 represents a loss on the railways due to a poor wheat harvest for 1925-26, and also to increased labor costs, arising, it is said, from the Federal arbitration court

awards. During 1925-26 143.65 miles of new railways were opened. The total route mileage was 4888, as compared with 4807 in 1924-25. Operations for the same year resulted in a large deficit, due mainly to increases in operating expenses. The annual report of the railway commissioners gives the deficit as £182,369, but this amount is independent of the sum of £309,353, which was paid out of consolidated revenue to the department for losses on non-paying lines, and for the loss incurred in connection with the reduction of 10 per cent in freight charges for certain classes of agricultural produce, which reduction became operative in October, 1924. The total deficit from railway operations was approximately £491,700. The gross revenue for the year was £12,743,566, a decrease of £86,716 compared with 1924-25. Although operating expenses increased from £9,485,844 to £9,592,160, the amount per average mile open decreased from £2119 to £2014. The interest charges and expenses during the year were £3,092,695. The executive power is vested in a governor, acting through a responsible ministry; and the legislative power, in a parliament of two houses; namely, the legislative council of 34 members elected for years and subject to property qualifications, and a legislative assembly of 65 members elected by universal male and female suffrage. The governor in 1926 was the Earl of Stradbroke; the prime minister and minister of water supply was J. Allan.

**VILLALOBAR,** MARQUIS OF. Spanish diplomat, died at Brussels, Belgium, July 9. He was born in 1866, and after completing his education entered the Spanish diplomatic service, in which he spent practically his whole life. In 1909 he was appointed Spanish Ambassador to Washington, and in 1913 was transferred to Belgium, where he served during the World War. As a neutral envoy he represented the interests of the allied nations. On the outbreak of the submarine activity, Villalobar protested to the German Governor General in Brussels against the manner in which it was being carried out, warning the central powers that they were antagonizing the American people, and that a continuance of such tactics would spell intervention and defeat.

**VIOLINISTS.** See MUSIC.

**VIRGINIA.** POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,309,187. The estimated population on July 1, 1926, was 2,519,000. The capital is Richmond.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	1,694,000	46,585,000	\$39,597,000
	1925	1,681,000	86,982,000	37,352,000
Tobacco	1926	188,000	182,852,000	25,412,000
	1925	200,000	129,400,000	20,186,000
Hay, tame	1926	979,000	992,000	19,344,000
	1925	1,020,000	779,000	18,359,000
Potatoes	1926	184,000	11,658,000	18,070,000
	1925	180,000	11,700,000	22,815,000
Sweet potatoes	1926	43,000	5,375,000	5,375,000
	1925	37,000	3,996,000	5,195,000
Wheat, winter	1926	687,000	11,836,000	14,850,000
	1925	680,000	8,946,000	14,403,000
Cotton	1926	101,000	55,000	52,535
	1925			
Peanuts	1926	188,000	181,100,000	5,244,000
	1925	188,000	148,520,000	5,741,000

Crop	Year	Average	Prod. bu.	Value
Oats	1926	186,000	4,886,000	3,047,000
	1925	192,000	4,128,000	2,890,000
Apples	1926		19,902,000	10,450,000
	1925		7,844,000	8,785,000

\* pounds. \* tons. \* bales.

**MINERAL PRODUCTS.** Coal, the most important of the State's minerals, furnishing the greater part of the total value of its annual mineral output, was actively mined in 1925. Production of coal was 12,779,443 net tons, as against 10,693,464 tons in 1924. The coal product in 1925 was valued at \$23,496,000; in 1924, \$21,823,000. Clay products totaled \$4,288,640 in 1924; in 1923, \$4,318,752. Of stone were produced 2,223,620 tons in 1924 and in 1923, 2,216,140; in value, \$2,566,575 in 1924 and in 1923, \$2,482,037. The State was not an important producer of iron ore in 1925 or in 1924, the quantity of this product having fallen off sharply. It produced 97,884 long tons of pig iron in 1925 and 94,462 long tons in 1924; having a value of \$2,237,749 for 1925 and for 1924, \$2,268,022. Production of coke was important, attaining 485,064 short tons in 1924 and 774,887 in 1923; in value, \$2,343,081 in 1924 and in 1923, \$5,086,612. Sand and gravel, lime, talc and soapstone, zinc, and lead were products of secondary importance. The total value of the State's mineral product, duplications excluded, was in 1924, \$37,962,143; in 1923, \$48,052,018.

**FINANCE.** As summarized by the U. S. Department of Commerce, payments for the maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$19,675,760. Their per capita rate was \$8.07, as against \$8.71 in 1924 and \$3.96 in 1917. Their total included \$5,530,056 for education, apportioned among the minor State divisions. Payments amounting to \$744,020 for interest on debt and \$12,540,871 for permanent improvements, added to payments for maintenance and operation of State departments, made the year's total of State payments \$32,960,651. For highways was expended the sum of \$14,104,072, of which \$2,492,685 was for maintenance and \$11,611,387 for construction.

Revenue receipts of the State were \$30,261,951, or \$12.42 per capita. They exceeded by \$9,842,171 the total payments except those for permanent improvements, and were \$2,698,700 less than the total with these included. Payments in excess of receipts were met from proceeds of debt obligations. Property and special taxes formed 34.8 per cent of the revenue in 1925, as against 35.5 per cent in 1924 and 41.2 per cent in 1917. Their per capita rate was \$4.32 in 1925, \$4.13 in 1924 and \$1.96 in 1917. Earnings of the departments and compensation for officials' services furnished 8.8 per cent of the 1925 revenue; business and non-business licenses, 40.7 per cent. License receipts included those from taxes on incorporated companies, on sales of gasoline and on motor vehicles.

The net indebtedness of the State on June 30, 1925, was \$26,211,181, or \$10.76 per capita, as against per capita rates of \$9.99 in 1924 and \$10.21 in 1917. The debt total included debt occasioned by advances made to counties for highway construction. The assessed valuation of property subject to State tax was \$2,029,821,959. The State tax levy was \$7,328,742, or \$3.01 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 4554. No new construction of moment occurred in 1926. The Chesapeake and Ohio abandoned 4 miles of line near Mineral.

**EDUCATION.** Efforts to improve the standard of professional qualifications for teachers continued to make progress. The State board of education, according to Harris Hart, State superintendent of public instruction, was at last practically in the position to assert that no one might teach in the public schools unless qualified by one year of professional training subsequent to high-school graduation. The division of school buildings was credited with effecting important improvement in the field of school-house construction. Enrollment in the public schools of the State in the academic year 1925-26 totalled 551,476; that in the common schools was 492,654, and that in the high schools 58,822. Expenditure for public education in the State in the year amounted to \$23,788,215. Salaries of teachers in high schools averaged \$1144; in elementary schools, \$622.

**CHARITIES AND CORRECTIONS.** The State Board of Public Welfare has control or supervision over State and county charitable and penal institutions. It undertook in 1926 to replace certain of the old county almshouses of the State with what was to be called the Eighth district almshouse. It was reported that 18 counties had discontinued almshouses since 1909. The aim was to reduce the remaining almshouse population by allowances, hospitalization, and other forms of State aid, and to provide eventually for the residue of almshouse inmates in regional almshouses or in a State institution. The Virginia penitentiary had an industrial system, a farm and a series of road camps in which some 1400 convicts were employed in constructing modern-type roads. Prisoners in jails, the penitentiary and the juvenile reformatories on June 30, 1925, numbered 4776. Committed insane numbered 6478; feeble-minded and epileptics, 936.

**LEGISLATION.** The General Assembly voted against ratification of the Federal Child Labor amendment, January 14, by 54 to 1. The measure recommended by Governor Byrd, to put taxation of land values in the hands of the counties and taxation of intangibles in the hands of the State, was enacted. The legislature further enacted a higher rate, 4½ cents to the gallon, for the tax on sales of gasoline, and revised the scale of payments for automobile licenses to correspond with weight instead of horsepower. The fee system for the payment of tax assessors, sheriffs and certain other officers was limited to a fee maximum of \$7500 a year. Legislation reducing the number of administrative bureaus was passed. The session approved an amendment to the State constitution limiting the executive offices disposable by popular ballot to those of Governor, lieutenant-governor and attorney-general, allowing the Legislature to elect the auditor and requiring all other officers to be made by Governor's appointment. The amendment, before becoming effective, had to await passage by a second legislature in 1928, and popular ratification in that year. A measure was enacted reducing the tax rate on non-resident corporations to 50 cents (previously \$1.10), and the tax on capital, previously \$1.16, to 85 cents.

**POLITICAL AND OTHER EVENTS.** Governor Harry Flood Byrd was inaugurated February 1. He ordered 8 hours of work daily in the State government offices. Pledged to extensive government reforms, he advocated to the Legislature that the State renounce taxation of land values, this form of taxation to be reserved to the counties, and that all power to tax intangibles be vested in the State alone. He proposed an increase from 3 to 4½ cents a gallon on gasoline, and a grading of automobile license costs according to weight instead of horsepower. He also recommended that the State and counties be investigated by the Bureau of Municipal Research, with the object of finding recommendations for future reforms. He maintained harmonious relations with the legislature, which enacted a great number of his proposals. A hard-surfaced road from Winchester to Bristol, running the length of the State, was completed during the year, and the extension of the Washington-Richmond hard-surface highway from Richmond toward the North Carolina line was carried on, with the intention of completing it in the summer of 1927. A State power survey, to serve as guide in State power-development policy, was carried on, the State's water-power resources, totaling some 810,000 hp., being about 89 per cent undeveloped, and unmined coal being reckoned at approximately 21,000,000,000 tons. Private citizens pledged a total of \$1,000,000, in a campaign for the purchase of a strip of the Blue Ridge from Front Royal to Staunton, to form a Shenandoah National Park. The State's representatives, 10 in number, and all Democrats, were reelected to the 70th Congress in November.

**OFFICERS.** Governor, Harry F. Byrd; Lieutenant Governor, Junius E. West; Secretary of the Commonwealth, B. O. James; State Treasurer, John M. Purcell; Auditor of Public Accounts, C. Lee Moore; Attorney General, John R. Saunders; Superintendent of Public Instruction, Harris Hart; Commissioner of Agriculture, George W. Koiner.

**Judiciary.** Supreme Court of Appeals: President, Robert R. Prentiss; Associate Justices, J. F. West, Martin P. Burks, Preston W. Campbell, R. H. L. Chichester.

**VIRGINIA, UNIVERSITY OF.** A non-sectarian institution of higher education at Charlottesville, Va.; founded in 1819. The enrollment for the 1926 fall term was 2101, distributed as follows: College, 1264; education, 93; graduate students, 122; engineering, 127; law, 262; medicine, 233. For the 1926 summer session the registration totaled 2766. The faculty numbered 250, 110 of whom were above the rank of instructors, 10 professors having been added during the year. The endowment funds of the university amounted to \$3,673,000, and the annual income was \$1,251,000, as follows: From endowment, \$180,000; from State appropriations, \$373,000; from fees, \$387,000; from miscellaneous sources, \$311,000. There were approximately 140,000 volumes in the library. President, Edwin Anderson Alderman, D.C.L., LL.D.

**VIRGIN ISLANDS.** The name given by the United States government to the former Danish West Indies, purchased by the American government from Denmark by the treaty proclaimed Jan. 25, 1917; also a group of islands belonging to the British colony of the Leeward Islands (q.v.). The Virgin Islands of the United States

consist chiefly of the Islands of St. Thomas, St. Croix, and St. John, and have a total area of about 132 square miles, with a population, according to the census of Nov. 1, 1917, of 26,051, of whom 80 per cent were negroes, 13 per cent of mixed races, and 7 per cent whites. St. Thomas, with an area of 28 square miles, had 10,191 inhabitants; St. Croix, 84 square miles, 14,901 inhabitants; and St. John, 20 square miles, 959 inhabitants. St. Thomas, the chief port, has coaling and oil fueling stations. Education is compulsory. For the fiscal year 1924-25, trade with the United States was: Imports, \$1,616,468, exports, \$595,375. Governor in 1926, Capt. Martin E. Trench, U.S.N.

**VITALISM.** See ZOOLOGY.

**VITAMINS.** See CHEMISTRY; FOOD AND NUTRITION.

**VOCALISTS.** See MUSIC.

**VOGT, AUGUSTUS STEPHEN.** Canadian organist and choral conductor, died in Toronto, September 17. He was born at Washington, Ontario, Aug. 14, 1861. After one year of study at the New England Conservatory, in Boston, he went, in 1885, to the Leipzig Conservatory, where his teachers were Ruthardt, Reinecke and Jadassohn. He graduated in 1888, and returned to Canada as teacher of piano at the Toronto College of Music, 1888-92. In 1892 he accepted a similar position at the Toronto Conservatory of Music, of which he became director in 1913. From 1888 to 1906 he also held the position of organist and choirmaster at the Jarvis Street Baptist Church, and from 1918 until his death he was dean of the music department at Toronto University. In 1894 he founded the Mendelssohn Choir, of which he was conductor till 1917. Before long, this organization had won a high reputation, not only in Canada and the United States, but was recognized even in Europe as the equal of the famous Philharmonic Choir of Berlin. During a very successful tour of the United States, in 1912, Dr. Vogt set a new standard of perfection for choral ensemble, and upon his return was elected honorary member of the National Club of Toronto. In 1907 the University of Toronto conferred upon him the degree of Mus. Doc. He was the author of *Modern Pianoforte Technic*, and several a capella choruses.

**VOLCANOES.** See GEOLOGY.

**VOLHYNIA, vól-In'îa.** A part of the Soviet Republic of Ukraine (q.v.); formerly a part of the Russian Empire; lying east of Poland and Galicia in West Russia. Area, 27,699 square miles; population, Jan. 1, 1915, 4,241,800. Capital, Zhitomir, with an estimated population before the War of 96,800.

**VOLUNTEERS OF AMERICA.** A non-sectarian philanthropic organization founded by General and Mrs. Ballington Booth, in March, 1896. Operations were begun without funds, but with many friends, with central offices in the Bible House, New York City. The society was incorporated on Nov. 6, 1896, under the laws of the State of New York. The society works in harmony with the evangelical churches. No pledge of life membership is required of its members; it promotes its officers on a merit system; its funds are audited at stated periods, and balance sheets are issued. The society has 60 homes or institutions throughout the United States. Thirteen of these are for the care of children, 10 for widowed mothers with children, four for

women only, and there are two homes for elderly people, four working girls' homes, three "hope halls" for discharged prisoners, 18 industrial homes for men, six homes for emergency shelter or temporary relief, and a well-equipped hospital at Baltimore. The summer camps number 14, and the society owns the property and equipment of most of these. The winter activities of the society embrace all branches of relief work in a number of cities, in conjunction with the gospel mission work. The following record gives some idea of the work accomplished during 1926: The total number of public meetings was 27,988, at which there was reported an attendance of 3,221,009. The number who professed conversion, the turning to better ways of life, at these gatherings was 10,374. The various homes, missions, and institutions provided 500,178 lodgings, 265,376 of which were given free, the balance for nominal fees or in return for work. Homeless men and women were supplied with 1,384,888 meals, and of these 756,514 were given free. Employment was given to 33,502 persons, or work was found for them. Persons and families assisted in various other ways numbered 93,557. Among the needy, 129,357 garments and pairs of shoes were distributed. It is recorded that 83,815 pastoral visits were made by Volunteer officers and workers during the year. Headquarters are at 34 West 28th St., New York City. In 1926 General Ballington Booth was president; Col. James W. Merrill, secretary; and Col. Walter J. Crafts, treasurer.

**VORARLBERG**, für'arl-bërk. A province of the new republic of Austria since the overthrow of the Dual Monarchy; formerly a crownland of the Austro-Hungarian monarchy. Area, 1005 square miles; population, according to the census of 1923, 139,968. Capital, Bregenz.

**WADSWORTH**, JAMES WOLCOTT. American congressman and former controller of New York State, died at Washington, D. C., December 24. He was born Oct. 12, 1846, at Philadelphia, Pa., the son of Gen. James S. Wadsworth, of Genesee, N. Y. He received his education at the Hopkins Grammar School, New Haven, Conn., leaving, however, in the fall of 1864 to join the Union Army. He served as volunteer aid on the staff of General G. K. Warren, commanding the Fifth Army Corps, until January, 1865, when he was commissioned captain of volunteers. In April, 1865, he was breveted major of volunteers for gallant and meritorious service at Five Forks. Returning to the family home in Livingston County, N. Y., Major Wadsworth assumed the management of extensive farm interests. He served as county supervisor in 1875, 1876, and 1877, and in 1878-79 he was an assemblyman. In 1880-81 he was State controller, and then was elected to the Forty-seventh Congress, subsequently serving in the Forty-eighth, and from the Fifty-second to the Fifty-seventh. He retired in 1907. He was a member of the New York constitutional convention of 1915, and at one time president of the Board of Managers of the National Home for Disabled Soldiers. He was for many years President of the Genesee National Bank of Genesee, N. Y., and the Genesee River National Bank of Mount Morris, N. Y. He was the father of United States Senator James W. Wadsworth, Jr., of New York.

**WAINWRIGHT**, RICHARD. American naval officer, died March 6. He was born at Washington, D. C., Dec. 17, 1849, and was appointed

to the U. S. Naval Academy by the President, in 1864. He graduated in 1868, and was commissioned a lieutenant in 1873, commanding for a time the coast survey vessel *Arago*. He was successively flag-lieutenant to Admiral Patterson, and secretary to Admiral Jouett, and was promoted to the rank of lieutenant-commander in 1894. In February, 1898, he was executive officer of the battleship *Maine* when that vessel was destroyed in Havana harbor, and during the Spanish-American War he commanded the converted yacht *Gloucester*, taking a distinguished part in the naval battle of Santiago. In 1899 he was made commander, and captain in 1903. From 1902 to 1904 he commanded the cruiser *Neuark*, and from 1904 to 1907 he was a member of the General Board. From 1907 to 1908 he commanded the battleship *Louisiana*, and in the last-named year he was promoted to rear admiral. From 1908 to 1910 he was in command of the Second and Third Divisions of the Atlantic Fleet. In 1910 he became aid for operations, and remained such until his retirement in the following year.

**WALDO**, CLARENCE ABIATHAR. American mathematician, died Oct. 1. He was born at Hammond, N. Y., Jan. 21, 1852. He studied at Wesleyan University, graduating in 1875, and receiving the A.M. degree in 1878. He was instructor in mathematics and registrar of Wesleyan University, from 1877 to 1881, and then studied at the Universities of Leipzig and Munich, 1882-83. After his return from abroad he was professor of mathematics at Rose Polytechnic Institute, Terre Haute, Ind., from 1883 to 1891. For two periods, 1885-86 and 1888-89, he served as acting president. From 1891-95 he was professor of mathematics at De Pauw University, and from 1895 to 1908 at Purdue University. Dr. Waldo was called to Washington University, St. Louis, in 1908, to become Thayer Professor of Mathematics and Applied Mechanics, serving until 1917 when he was made professor emeritus. He was a Fellow of the American Association for the Advancement of Science (vice-president of Section D, 1902-03; secretary of council, 1903-04, and general secretary, 1904-05). He was the author of *A Manual of Descriptive Geometry* (1888), and was editor of the *Proceedings of the Indiana Academy of Science* for the years 1896-98, and of the *Proceedings of the Society for the Promotion of Engineering Education*.

**WALES**. A historical division of the United Kingdom, consisting of 12 counties on the west coast of Great Britain, between the Irish Sea on the north and the Bristol Channel on the South. Area, 7466 square miles; population, according to the census of 1921, 2,206,712. See GREAT BRITAIN.

**WALKLEY**, ARTHUR BINGHAM. British dramatic critic, died October 8. He was born at Bristol, Dec. 17, 1855, and was educated at Warminster School, and at Balliol College and Corpus Christi College, Oxford. In 1877 he entered the secretary's office in the General Post Office, London, and was secretary to the British delegation to the Washington postal congress in 1897, and secretary to the Imperial Penny Postage Conference in 1898. He was a British delegate to the Rome congress in 1906. From 1911 to 1919 he was assistant in the General Post Office. In addition to his official duties, he undertook dramatic criticism, soon becoming known as an

authority on the stage and drama. For a long period he was associated with the *London Times*, in the capacity of dramatic critic. Among Walkley's many and varied publications are included *Playhouse Impressions* (1892); *Frames of Mind* (1899); *Dramatic Criticism* (1903); *Drama and Life* (1907); *Pastiche and Prejudice* (1921); *More Prejudice* (1923); and his last work in book form, *Still More Prejudice* (1925).

**WALLER, LITTLETON WALLER TAZEWEEL.** Officer of the U. S. Marine Corps, died July 13, at Atlantic City, N. J. He was born in York County, Va., Sept. 26, 1856, and in June, 1880, received appointment as a second lieutenant in the Marine Corps. Before the beginning of the Spanish-American War he had attained the rank of captain. He was present at the destruction of Cervera's fleet at Santiago. Later he went to China with the international expedition, in the Boxer rebellion. He was brevetted lieutenant colonel "for distinguished conduct and public service" in the presence of the enemy near Tientsin. He was advanced two numbers in grade "for eminent and conspicuous conduct" in the battle at Tientsin. On his return to the United States, he was in charge of recruiting in New Jersey, Pennsylvania and Delaware. In 1904 he commanded a provisional regiment of marines at the Isthmus of Panama, and led the expeditionary forces in Cuba in the intervention of 1906. In 1911 he again commanded a brigade of marines in Cuba. He was at Mare Island Navy Yard, 1911-1914, and in 1914 he commanded the first brigade of marines for service in Mexico. In 1915-16 he commanded the marine expeditionary forces in Haiti, and in 1917 he was made commander of the advanced base force at Philadelphia. He retired from active service in June, 1920. He had been promoted to brigadier general in August, 1916, and to major general in August, 1918.

**WARD, THOMAS HUMPHREY.** British art critic and journalist, died May 6. He was born at Hull, Nov. 9, 1845, and was educated at Merchant Taylors' School, and at Brasenose College, Oxford. He became a fellow of Brasenose in 1869 and was a tutor of the college, 1870-1881. He then became a writer on the *Times* of London, soon being widely known, not only for the freshness of his style in his editorials, but for the acuteness of his art criticism. He married in 1872 Mary Augusta, daughter of Thomas Arnold, a well known English educator and historian; she was the novelist, Mrs. Humphry Ward (died 1920), who wrote *Robert Elsmere*.

Humphry Ward was the editor of *The English Poets* (1881 to 1918), and of *English Art in the Public Galleries of London* (1888). He was also editor of the work called *Men of the Reign* (1885), *The Reign of Queen Victoria* (1887), and *Men of the Time* (12th ed.). He wrote alone, *Humphry Sandwith, A Memoir*, and, jointly, *The Oxford Spectator* (1868); and *Romney* (1904).

**WASHINGTON. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,356,621. The estimated population on July 1, 1926, was 1,538,000. The capital is Olympia.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Wheat, winter	1926	847,000	19,481,000	\$22,403,000
	1925	872,000	9,821,000	12,571,000
Wheat, spring	1926	1,260,000	20,790,000	24,324,000
	1925	1,700,000	30,408,000	39,863,000
Hay, tame	1926	923,000	2,055,000	28,154,000
	1925	908,000	2,048,000	30,720,000
Potatoes	1926	67,000	10,720,000	10,184,000
	1925	58,000	8,680,000	14,822,000
Oats	1926	229,000	9,847,000	5,219,000
	1925	254,000	11,176,000	5,812,000
Corn	1926	49,000	1,715,000	1,629,000
	1925	58,000	2,080,000	1,928,000
Barley	1926	64,000	2,176,000	1,404,000
	1925	91,000	3,094,000	2,104,000

\* tons.

**MINERAL PRODUCTION.** Coal, in respect to value of the annual total attained, was the State's leading mineral product. The coal mine output declined somewhat in 1925, to 2,415,000 short tons, from 2,653,667 in 1924. The product of 1924 was valued at \$9,689,000, that of 1923 at \$10,894,000. Cement was produced to the quantity of 2,481,000 barrels in 1925, as against 1,842,113 in 1924. Cement shipments of 1925 had a value of \$5,498,000; those of 1924, \$4,236,554. Clay products in 1924 were valued at \$2,607,397, and in 1923 at \$2,296,242. While these three products furnished about three-fourths of the total value of the yearly mineral output, stone, sand and gravel were produced in important quantities. The State was also a considerable producer of the mineral group, gold, silver, copper, lead, and zinc. The total value of the product of these five metals in 1925 was \$1,092,464, and in 1924, \$948,490. Of gold were produced 11,138 fine ounces in 1925 and 14,977 in 1924; of silver, 166,425 fine ounces in 1925 and 213,742 in 1924; of copper, 1,159,057 pounds in 1925 and 928,458 in 1924; of lead, 5,627,241 in 1925 and in 1924 3,935,376; of zinc, 1,217,846 pounds in 1925 and 910,890 in 1924. The total value of the State's mineral product in 1924 was \$21,159,370; in 1923, \$22,169,191.

The value of the gold, silver, copper, lead, and zinc produced from ore mined in the State of Washington in 1926 was \$881,000, as estimated by the Bureau of Mines. The production of gold decreased to \$188,100, as a result of the closing of the Boundary Red Mountain mill in Whatcom County. The output of silver decreased to 159,000 ounces. The output of copper decreased slightly to 1,100,000 pounds. The output of lead decreased to 4,500,000 pounds, valued at \$373,500. The production of zinc recovered from concentrate was about 23 per cent less than in 1925.

**FINANCE.** As summarized by the United States Department of Commerce, the payments for the maintenance and operation of the general departments of the State in the fiscal year ending Sept. 30, 1925, were \$18,650,130. Their per capita rate was \$12.66, as against \$13.13 in 1924 and \$5.28 in 1917. Their total included \$8,502,918 for education, apportioned among the minor State divisions. Payments amounting to \$641,555 for interest on debt and \$10,210,014 for permanent improvements, added to payments for maintenance and operation of State departments, made the year's total of State payments \$29,501,699. For highways was expended the sum of \$9,657,010, of which \$1,259,198 was for maintenance and \$8,397,812 for construction.

Revenue receipts of the State were \$31,253,550, or \$21.22 per capita. They exceeded by

\$11,901,871 the total payments, except those for permanent improvements, and, furthermore, exceeded by \$1,751,857 the total with these included. There resulted an increase in the State's cash balances. Property and special taxes formed 46 per cent of the revenue in 1925, as against 53.5 per cent in 1924 and 66.8 per cent in 1917. Their per capita rate was \$9.76 in 1925, \$11.88 in 1924 and \$6.10 in 1917. Earnings of the departments and compensation for officials' services furnished 6 per cent of the 1925 revenue; business and non-business licenses, 31.9 per cent. License receipts were increased by larger amounts obtained from the gasoline tax and from the licensing of automobiles. They included also the proceeds of taxation of incorporated companies.

The net indebtedness of the State, Sept. 30, 1925, was \$10,066,363, or \$6.84 per capita, as against \$7.31 per capita in 1924 and 52 cents in 1917. The assessed valuation of property subject to State tax was \$1,158,026,676. The State tax levy was \$11,926,515, or \$8.10 per capita.

In the fiscal year ending Sept. 30, 1926, operation and maintenance payments for the State departments were \$20,515,354; interest on debt, \$638,720; outlays for permanent improvements, \$11,495,605. The combined total of the payments was \$32,649,679. Revenue receipts aggregated \$31,013,970. The net State indebtedness stood September 30 at \$11,331,780. The assessed valuation of property subject to the State ad valorem tax in 1926 was \$1,207,621,667. The State tax levy was \$16,109,673.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 5559. There was constructed in 1926 new first track totaling some 7 miles.

**EDUCATION.** The year brought an increase of about 1000 in the number of high-school graduations, according to J. C. Preston, as quoted in the *Journal of the National Education Association*. Qualification requirements for teachers were advanced. School consolidations went on at an increasing rate, and produced larger units for the purposes of school taxation and administration. In higher education, normal activities were disturbed by clashes between Governor Hartley and certain of the educational authorities disposed to resist political control. The millage rate for the purpose of supporting the higher schools was increased by approximately one-third, over the Governor's veto. (See also *Political and Other Events*, below.) As reported by the State Superintendent of Education, Josephine C. Preston, the number of children of school census age, from 4 or 5 to 21 years, in the school year 1925-26, was 414,373. There were enrolled in kindergartens 2991, in elementary schools 255,823 and in high schools 70,474; a total enrollment of 329,288. There were employed 11,377 teachers, principals and city superintendents. The salaries paid averaged, for men, \$1801 and, for women, \$1403 per annum. Current expense of public-school education in the State amounted for the year to \$24,325,053; capital outlay for school educational purposes to \$4,652,165.

**CHARITIES AND CORRECTIONS.** Among the charitable and correctional institutions of the State are three State hospitals, the State custodial school, soldiers' home, veterans' home, schools for the deaf and the blind, the State peniten-

tiary, State reformatory, and schools for girls.

**POLITICAL AND OTHER EVENTS.** At the election November 2, Wesley L. Jones, Republican, was reelected to the United States Senate, defeating A. Scott Bullitt, the Democratic candidate. Seattle elected a woman mayor, Mrs. Bertha K. Landes, March 9. Kenneth Mackintosh was selected to be chief justice of the State supreme court for the ensuing term, and William D. Askren and Walter M. French were to be associate justices, succeeding Justices Pemberton and Holcomb.

Governor Hartley encountered opposition in efforts to render the State system of higher education consonant with his views. The Board of Regents of the State university, by a vote mainly of his appointees, removed Dr. Henry Suzzallo as president. This act aroused sentiment sufficiently to cause the filing of a petition for the Governor's removal by a popular recall vote; it was filed with the Secretary of State October 18. Committees of citizens sought to obtain the 97,576 signatures necessary to a recall vote, but did not report obtaining that number up to the end of the year. Supporters of the Governor condemned Dr. Suzzallo as having disregarded the public interest by opposing the Governor's plan to put the State's five institutions of higher learning under a single board of regents. See WASHINGTON, UNIVERSITY OF.

A report of the State highway engineer, issued in December, stated that 2735 miles of the State highway system, out of a total of 3300, all outside the limits of incorporated cities and towns, had been improved up to that time, at a cost of \$90,000,000 to the State, the counties and the Federal Government, for construction and maintenance. There had been done since Mar. 1, 1925, 498 miles of new work, including 98 miles of concrete paving. The chief work undertaken during the two-year period, 1925-1926, was the construction of 7 steel and concrete bridges. Among these were one at Tacoma, over the Puyallup River tide flats and three railroad lines, a bridge of three spans, the largest 250 feet, with 1796 feet of approaches, costing \$664,910; and one over the Columbia River, the Vantage Ferry bridge, nine steel spans aggregating 1640 feet, costing \$628,496.

**OFFICERS.** Governor, Ronald H. Hartley; Lieutenant-Governor, W. Lon Johnson; Secretary of State, J. Grant Hinkle; Treasurer, W. G. Potts; Auditor, C. W. Clausen; Attorney-General, John Dunbar; Superintendent of Public Instruction, Josephine Corliss Preston.

**JUDICIARY.** Supreme Court; Chief Justice, John F. Main; Associate Justices, Emmet N. Parker, Mark A. Fullerton, John R. Mitchell, O. R. Holcomb, Kenneth Mackintosh, Warren W. Tolman, J. B. Bridges, William H. Pember-ton.

**WASHINGTON, UNIVERSITY OF.** A State institution of higher education at Seattle, Wash.: founded in 1861. The courses offered are: Liberal arts, science, engineering, fine arts, business administration, education, fisheries, forestry, journalism, law, library, mining, pharmacy, and graduate work. The enrollment for the autumn of 1926-27 was 6851, of whom 3965 were men and 2886 were women. The number of students in the 1926 summer session was 2697. The faculty numbered 304, distributed as follows: Professors, 66; associate professors, 35; assistant professors, 54; instructors, assistants, lecturers,

etc., 149. The income from all sources for the scholastic year 1925-26 was \$2,236,953. The library contained 212,361 volumes, and the first unit of the new library building was completed. The Henry Memorial Art Gallery, which, together with the collection which it was planned to house, was the gift of Horace C. Henry, was under construction. In the autumn of 1926, at a meeting of the Board of Regents, President Suzzallo was relieved of his duties as president of the university, by a vote of 5 to 2. No formal charges were brought against the president, but previously the Governor of the State, who has power to remove Regents without establishing cause, did this in the case of three members. He had, before this, appointed two new Regents to fill vacancies occasioned by the expiration of terms, and the vote of the five to relieve President Suzzallo was believed to be in pursuance of the Governor's policy regarding the conduct of the university. A subsequent meeting of the Regents fixed Dec. 1, 1926, as the end of President Suzzallo's term, and elected as acting president Dean David Thomson. He had been at the University of Washington since 1902, when he was made professor of Latin, and had been dean of the college of liberal arts from 1916, acting as one of the administrative deans to assist the president, and becoming dean of the faculties in January, 1926.

**WASHINGTON, BICENTENNIAL.** See CELEBRATIONS.

**WASHINGTON AND JEFFERSON COLLEGE.** A non-sectarian institution of higher education at Washington, Pa.; founded in 1802. The enrollment for the autumn of 1926 totaled 501, of whom 14 were post-graduates. The summer session had a registration of 280. There were 37 members on the faculty, including one on leave of absence. The productive funds of the college amounted to \$1,441,128, and the income from all sources during the year was \$202,812. The library contained 38,194 volumes. President, S. S. Baker, M.S., LL.D.

**WASHINGTON AND LEE UNIVERSITY.** A non-sectarian institution of higher education at Lexington, Va.; founded in 1749. The enrollment for the autumn of 1926 was 907. The faculty numbered 54. The productive funds of the university amounted to \$1,317,970, and the income for the year to \$286,115. The library contained 60,000 volumes. President, Henry Louis Smith, Ph.D.

**WASHINGTON UNIVERSITY.** A non-sectarian, coeducational institution of higher education at St. Louis, Mo.; founded in 1853. The enrollment Oct. 4, 1926, was 5642, distributed as follows: Graduate students, 146; college of liberal arts, 1491; engineering, 387; architecture, 104; business and public administration, 139; law, 202; medicine, 342; dentistry, 153; fine arts, 275; extension division, 2229; nursing, 174. There were 837 students registered for the summer session of 1926. The faculty numbered 494, including 87 professors, 76 assistant professors, and 40 associate professors. Among the new appointees were Alexander S. Langsdorf, director of the department of industrial engineering and research; Dr. Charles S. Potts and Wiley B. Rutledge, Jr., professors of law; Dr. Russell G. Fobes, instructor in materia medica and prosthetic dentistry, and registrar of the school of dentistry. The value of the buildings and grounds of the institution was

estimated at \$7,923,716, the endowment was \$13,277,852, and the income for the year 1925-26 was \$1,859,770. The library contained 250,000 volumes and 100,000 pamphlets. Completed during the year 1925-26 were the Field House for athletics, costing \$283,116.66, and the W. K. Bixby Hall of Fine Arts, costing \$250,000. Under construction were the Rebstock Hall for Biology, to cost \$300,000, the St. Louis Maternity Hospital, affiliated with the school of medicine, to cost \$600,000, and additions to the nurses' home, also affiliated with the school of medicine, to cost \$450,000. Gifts received during the year amounted to \$1,290,127, of which the largest was the Charles Rebstock gift of \$1,000,000 for biology hall and general endowment. New courses were established in industrial engineering. Chancellor, Herbert S. Hadley, LL.D.

**WATER POWER.** During the fiscal year ended June 30, 1926, the U. S. Federal Power Commission reported that construction had been started on 20 new projects which would have, when completed, an installation of 1,220,000 horse power or 40 per cent of the total placed under construction during the preceding five years. These new projects included the Lock 18 development of the Alabama Power Company on the Coosa River in Alabama with 180,000 horse power; the combined power and navigation development at the Falls of the Ohio, Louisville, Ky., with 135,000 horse power; the Conowingo development of 473,000 horse power on the Susquehanna River in Maryland and Pennsylvania; and five projects in California aggregating 417,000 horse power. These projects brought the total of plants placed in operation or under construction under license of the Commission since July 1, 1920, to 3,900,000 horse power.

A major project which was considered during the year was the development of power on the St. Lawrence River in the United States and Canada. The Joint Board of Engineers of both countries appointed in 1924 to examine and report on the project presented its report during 1926, this report being favorable to the carrying out of the development. The report dealt with the general engineering features and their practicability, which was fairly well established, but it did not decide when and by whom the development should be made, as the question naturally was one involving political considerations.

The Federal Power Commission had 726 power applications filed up to July 1, 1926, and of these 523 were for major projects. Of the latter number, 250 had been cancelled or withdrawn leaving 273 in active status with a capacity in horse power of proposed installations of 24,750,000 horse power. For the major projects, 137 permits and licenses were outstanding on July 1 with an aggregate of 10,100,000 horse power, leaving 136 major applications with a total of 14,690,000 horse power then awaiting action by the Commission.

On Jan. 1, 1926, it was stated that the capacity of water wheels in plants of 100 horse power or more was in excess of 11,000,000 horse power, and of the total power produced by central stations in 1925, 36 per cent was produced by water power. In the first nine months of 1926 the percentage had increased to 38. In December, 1926, out of a total production of 6,794,453,000 kw.-hr. by public utility power plants in the

United States, 2,384,728,000 was from water-power and 4,409,725,000 from fuel.

In New York State applications were made to the Water Power Commission for a license to develop the international section of the river, but these were withdrawn before the end of the year at the instance of Governor Smith and it was an open question whether water power development in the State should be carried on by a private corporation or as a state-owned and controlled utility.

At Muscle Shoals eight units totalling 260,000 horse power were in operation during the year by the United States Government engineers and it was estimated that about 450,000,000 kw.-hr. were generated in 1926, an amount that by 1929 would be increased to 1,000,000,000 kw.-hr. This matter, as outlined under Muscle Shoals (q.v.) was being discussed in Congress.

The Conowingo development was started during the year and the plant under construction was being built for an initial installed capacity of 378,000 horse power and an ultimate capacity of 600,000 horse power. Contracts were let during the year for the turbo-generators, seven in number, each unit having a rating of 54,000 horse power. The turbines, which are of the vertical Francis type, are designed to operate under a head of 89 feet at 81 revolutions per minute, being the largest capacity machines so far built for heads of less than 100 feet, the runners having an outside diameter of 17 feet 9 inches and a total weight of 200,000 pounds, and the spiral casings an inlet diameter of 27 feet.

Another important installation of the year was three 17,500 horse power units at the Belows Falls plant of the New England Power Company, to operate under a 57-foot head at 85.7 revolutions per minute. These units also are of the vertical shaft Francis type with runners 11 feet in diameter and weighing 100,000 pounds.

At the Santeclah development of the Tallahassee Power Company there was being installed two 33,000 horse power units to operate under a head of 660 feet at 450 revolutions per minute. The Southern California Edison Company, in its Big Creek Number 2-A plant, was installing two 56,000 horse power double overhung impulse type wheels to operate under a head of 2300 feet at 250 revolutions per minute. These machines were notable as being larger by 16,000 horse power than any of this type previously constructed. Another notable project in California was the installation of two 30,000 horse power impulse double overhung units in the Bucks Creek development of the Feather River Power Company, to operate under a head of 2548 feet. The San Joaquin Light and Power Company, at its Balch development, was installing a high-head unit of 40,000 horse power, to operate under a head of nearly 2400 feet. It was stated in *Power* that in 1925 and 1926 there had been put into operation or contracts made for nearly 350,000 horse power of units ranging in size from 36,000 to 56,000 horse power and for heads of 1900 feet and above. The São Paulo Tramway, Light and Power Company in Brazil was installing two units rated at 40,000 horse power, to operate under 2450 feet effective head.

In Canada two more 50,000 horse power units were installed in the Isle Maligne plant of the

Duke-Price Power Company at Lake St. John on the Saguenay River in Quebec, bringing the capacity of this plant to 500,000 horse power, with space for two more machines. Work was started on the Chute A Caron development, located about 20 miles below Isle Maligne, with indications that it would be prosecuted vigorously during 1927. The plans called for the development of 1,000,000 horse power in one station. For the Great Falls plant of the Manitoba Power Company there was placed an order for two additional units, one of which, of the Moody propeller type, was rated at 28,000 horse power and was to operate under a 56-foot head, being the third of the units of this type to be placed in this plant. The fourth turbine was of the high-speed four-blade bell type, rated at 31,500 horse power, at 138 revolutions per minute. The Canadian International Paper Company was installing four 34,000 horse power units, to operate under a 93-foot head, at 100 revolutions per minute, in the Chelsea plant on the Gatineau River about eight miles above its junction with the Ottawa River. At the Furnace Rapids plant there were being installed four 24,000 horse power units operating under a head of 66 feet at 90 revolutions per minute. In each of these plants space was provided for a fifth unit when additional capacity was required.

**WATER POWER CONFERENCE.** A second World Power Conference was held at Basle, Switzerland, Aug. 31-Sept. 8, 1926, and was attended by some 700 representatives from 38 countries. It was primarily a European meeting, the largest delegations coming from Switzerland and Germany. The topics discussed concerned five leading subjects: Relation of water power to inland navigation; exchange of electrical energy between countries; the economic relation between electrical energy produced hydraulically and electrical energy produced thermally; electricity in agriculture; and railway electrification. The American committee presented papers on each of the above topics. During the year the proceedings of the first World Conference, held in London in 1924, were published in four volumes aggregating some 6000 pages. This conference, as reflected in the proceedings, covered the following divisions of the general power problem: National power resources; water power production; preparation of fuels; steam power production; internal combustion engines; power transmission and distribution; power in industry and domestic use; power in electro-chemistry and electro-metallurgy; power for transport; and the economic, financial, and legal aspects of power development.

**WATER SUPPLY.** See **AQUEDUCTS**; **WATERWORKS AND PURIFICATION.**

**WATER WHEELS.** See **TURBINES.**

**WATER-WORKS AND PURIFICATION.** After a long controversy over the choice among various proposed additional sources of water supply for the Boston Metropolitan District, the Massachusetts Legislature of 1926 created a special construction commission, with authority to divert water from the Ware River to the existing Wachusett impounding reservoir on the Nashua River, and with further authority to make studies for a new reservoir on the Swift River, and to study also the advisability of treating the existing supplies from the Sudbury and Cochituate sources by chlorination or filtra-

tion, or both. At the close of the year, borings were being made on the line of a proposed tunnel, about 13 feet in diameter and 12 miles long, and further borings at the sites of dams to form the new reservoir.

For New York City, the Board of Water Supply recommended an additional water supply of 434,000,000 gal. per day, to be taken from a series of reservoirs on streams east of the Hudson River and north of the existing Croton supply. The estimated cost of this project was \$348,000,000. In addition, the board renewed its earlier recommendation for an additional pressure tunnel to carry water from the reservoir at the end of the Catskill Aqueduct beneath Manhattan Borough, the East River, and to Brooklyn Borough, at an estimated cost of \$67,000,000.

The rapid growth of Detroit required the addition of 217 miles of distributing mains to the water-works system in 1926, and it is expected that at least an equal mileage will be required in 1927, together with some 20,000 new service connections to keep pace with the estimated annual growth of 100,000 in population. It is expected that an additional filtration plant, with a capacity of 200,000,000 gallons a day, a low-lift pumping station, and ten miles of brick or concrete water tunnels, 12 to 15 ft. in diameter, will also be built soon at Detroit.

San Francisco was continuing construction on its new Hetch Hetchy system water supply from the Tuolumne River. The Hetch Hetchy dam and a part of the aqueduct were completed, and a part of the long length of tunnel remained to be built. Opposite San Francisco, the East Bay Municipal Utility District, including Oakland and other cities, was making progress on its aqueduct, which was to bring water to the district from the Mokelumne River. Some 27 miles of 65-inch electrically-welded pipe line was completed, and it was expected that work would be finished during 1927 on the additional 26 miles. Work was also under way on some 19 miles of tunnels and other structures forming a part of the aqueduct. The contract for the dam which was to form an impounding reservoir on the Mokelumne River had been let. Los Angeles was continuing its activities for an immense additional supply of water, to be conveyed nearly 300 miles from the Colorado River. There was talk of the formation of a large water-supply district to include Los Angeles and the area southward to San Diego.

The Metropolitan Water Board of London, England, opened a double filtration and chlorination plant in July. It is on the River Thames, and had a capacity of 22,500,000 U. S. gallons a day, but ultimately will have nearly double that capacity. In 1926, there were 18 rapid or mechanical filters and six slow sand filters, the first operating at a rate of from 125 to 250 U. S. million gallons a day, and the second at some  $4\frac{1}{2}$  million U. S. gallons per day. This new plant was supplementary to the earlier slow-sand filter plants for London, the earliest of which was built in 1828, or nearly a century ago.

A revised edition of Stein, *Water Purification Plants* (New York) appeared during the year. See also **AQUEDUCTS**.

**WATTS, SIR PHILIP.** British naval architect, died in London, March 15. He was born May 30, 1846, and was educated at the College of Naval

Architecture. He was engaged as a constructor in the British Admiralty until 1885, when he became naval architect and director of the warship building department of Sir W. G. Armstrong and Whitworth & Co., Ltd. This post he filled from 1885 to 1901. In 1900-01 he equipped and sent out the Elswick Battery to the Boer War. From 1901 to 1912 he was director of naval construction at the Admiralty. From 1912 onward he was adviser on naval construction.

**WEATHER BUREAU.** See **METEOROLOGY**.

**WEBB, WILLIAM SEWARD.** American capitalist, died at Shelburne Falls, Vt., Oct. 29. He was born Jan. 31, 1851, at New York, and received his preliminary education at Churchill's Military School at Sing Sing, N. Y. He studied at Columbia for two years and afterward studied medicine in Vienna, Paris and Berlin. On his return to the United States he entered the College of Physicians and Surgeons in New York and was graduated in 1876. He practiced medicine for but a few years, taking up business, and established the Wall Street firm of W. S. Webb & Co. About 1881 he became president of the Wagner Palace Car Co., an office he held until the merger of that corporation with the Pullman Co. Dr. Webb was president of the Fulton Chain Railway Co., the Fulton Navigation Co., the Raquette Lake Transportation Co., and a director of the Pullman Co. and other corporations. He was the builder and former president of the Mohawk and Malone Railway, and was for a long time on the board of the Lake Shore and Michigan Southern Railway. He was well known as a breeder of horses, being an authority on hackneys.

**WEEKLEY, WILLIAM MARION.** American bishop of the United Brethren Church, died January 8. He was born Sept. 18, 1851, in Tyler County, Va., (later West Va.), and was educated at the common schools and at the Theological Institute. He entered the ministry of the United Brethren Church in 1870, and was a pastor for 12 years and a presiding elder for 11 years. He was appointed secretary of the General Church Election board, a position he occupied for ten years. In May, 1905, he was made bishop, and later bishop emeritus in view of his valuable services to his church. He was a trustee of the United Christian Endeavor Society. He was the author of *From Life to Life* (1899); *Getting and Giving* (1903); and *Twenty Years on Horseback* (1907).

**WEEKS, JOHN WINGATE.** American statesman and former Secretary of War, died at Lancaster, N. H., July 12, where he had been born Apr. 11, 1860. He lived on a farm with his parents until he was 17 years old. At the age of 18 he won an appointment to the U. S. Naval Academy at Annapolis and, four years later, became an ensign in the U. S. Navy. After two years' service he resigned, but continued his interest in the Navy and matters of defense, later serving as a volunteer in the Spanish-American War and accepting a Naval Reserve commission. In 1885 he went to Florida as surveyor and land commissioner for the Florida Southern R. R., but after three years returned to the North and became a partner in the firm of Hornblower & Weeks, bankers, of Boston. Notwithstanding his activity in a rapidly growing business, Mr. Weeks found time for public service. He contributed largely to the development of the Bay

State Naval Brigade, which at one time he commanded. In 1900 Mr. Weeks began to be a figure of importance in Republican political affairs. He was in 1902 elected mayor of Newton, Mass., and in 1905 was elected to Congress from the 12th Massachusetts District. As a member of the banking and currency committee of the House of Representatives he took an important part in shaping the Aldrich-Vreeland currency law. Mr. Weeks, in 1913, became United States Senator, succeeding Winthrop Murray Crane, and as a member of the Senate military committee he strenuously supported aggressive war measures during the World War. He served in the Senate until 1919, and between the time of his retirement from the Senate and his appointment as Secretary of War by President Harding, in 1921, devoted himself to the affairs of the Republican party, becoming a leader in the Presidential campaign of 1920. He was a member of the Republican National Committee from Massachusetts. In President Harding's cabinet Secretary Weeks had the arduous task of readjusting the military establishment after the World War, adjudicating contractors' claims, and disposing of billions of dollars' worth of war equipment. He could not refrain from expressing his opinion of Congressional action reducing the forces in the interests of economy, and some of his utterances brought bitter replies. In failing health, he was ordered by his physicians to relax his public efforts and rest. On the arrival of the body of the American unknown soldier he insisted on being allowed to participate in the exercises at the National Cemetery at Arlington. This effort and other exertions immediately thereafter brought about his breakdown.

**WEEVIL.** See ENTOMOLOGY, ECONOMIC.

**WEIR,** JOHN FERGUSON. American painter and sculptor, died April 8, at Providence, R. I. He was born at West Point, N. Y., Aug. 28, 1841, where his father was professor of drawing at the U. S. Military Academy. He received instruction from his father in drawing and painting, and before he was 20 years of age had opened a studio for himself in New York. In the Civil War, enlisting in the Seventh Regiment, New York National Guard, he served in the defense of Washington. In 1869 he was called to Yale University to be dean of the department of fine arts. During his administration the chair of architecture was established in the university, and it was at his solicitation that the famous Jarves collection of Italian primitives was purchased. Mr. Weir modeled the statues of Professor Stillman and President Woolsey for the Yale University campus, and did other notable work. He retired from Yale University in 1913. He was a member of the National Academy of Design, where his picture, "The Gun Foundry," was first exhibited. "The Forging of the Shaft" was bought in 1902 by the Metropolitan Museum of Art, New York, for its permanent collection. He was the author of *The Way, the Nature and Means of Revelation, Human Destiny, and of Revelation and the Life to Come*.

**WELDING OF STEEL BUILDINGS.** See BUILDING.

**WELFARE WORK.** NATIONAL CONFERENCE OF SOCIAL WORK. This body met May 28 in Cleveland and sat for a week. The layman can

get a vague idea of the organized character of social work in the United States to-day by considering the following partial list of constituent organizations or affiliated bodies that held group discussions: American Association of Social Workers; National Association of Travelers' Aid Societies; Mothers' Pension Bureau; Child Study Association; Child Welfare League; National Federation of Day Nurseries; National Tuberculosis Association; National Association of Visiting Teachers; American Association for Organizing Family Social Work; American Association for Community Association; The American Country Life Association.

One understands how difficult it is to cut one's way through this maze. The conference itself produced other disturbing thoughts. What, if anything, was the professional status of social work? What is the position of social work with regard to the modern scene, to industrialism, to the old political ideas of liberty and equality? Where is the old emotional basis of social work? What of leadership? Miss Gertrude Valle, the president, voiced some of these uncertainties. The others were apparent.

Important papers were read by Lawson Purdy of New York, Rabbi Abba Hillel Silver of Cleveland, Edward I. Devine, Julia Lathrop, Jane Addams, and others. There were twelve sectional meetings, as follows: Children, delinquents and correction, health, family, industrial and economic problems, mental hygiene, organization of social forces, public officials and administration, the immigrant, professional standards and education, educational publicity.

One may close by quoting Geddes Smith's impressions in *The Surrey*: "A successful conference? Yes. An enthusiastic conference? No. An inspiring one? Hardly. There was too little deep feeling; an underlying insecurity and a too intellectual effort to deal with it. . . . Until, on the other hand, it (the Conference) applies intensively some creative intelligence to its own procedures, it will fall short of its opportunity as a training school and forum for technical advance. The clutter of meetings, the uncoordinated programmes, the monotonous repetition of time-work methods of communication, the criss-cross sub-divisions, the feeble 'discussions,' all these aspects of the conference are no longer even news: they are taken for granted, and allowed to persist through sheer inertia." The new officers of the conference are John A. Lapp, president, and Howard Knight, secretary. The 1927 conference was to take place at Des Moines, Ia.

**JEWISH CONFERENCE.** The National Conference of Jewish Social Service met at Cleveland, May 23-26. The layman was more in evidence than heretofore, though it is one of the striking characteristics of Jewish social service that it is not nearly as professionalized as are other groups. The Jewish element in the papers and the discussions was pronounced. One need only quote the following from Dr. Maurice B. Hexter's presentation paper on the Jewish Federation movement: "Philanthropy for the Jew is as important an activity as is the synagogue itself in communal life. There has always existed a fundamental intimate relation between charity and religion." Dr. Hexter's paper indicated that the Jewish Federation movement had succeeded, and that the community chest could hold nothing out for the Jewish movement. This same

characteristic note was to be found in two sessions, that devoted to Jewish community centre secretaries and that devoted to Jewish education. There were good papers by Rabbi Max Kadushin ("The Place of the Jewish Centre in American Jewish Life"), by Henry Hurwitz, on the cultural force that the Menorah movement has become, and by S. Benderly, on the history of Jewish education in America. The papers devoted to welfare work, per se, were of high grade. Probably the most important was Dr. I. M. Rubinow's "The Future of Jewish Relief Work in the United States," which was a masterly presentation of the ideas underlying family service work. Dr. Rubinow dissipated with ease that group of fallacies that centred in the belief that family relief work must come to an end soon because of immigration restriction, economic circumstances, etc. Another important paper was Samuel Goldsmith's "National and International Jewish Work," which was a plea for the supervision and possibly control of non-local philanthropies. Other papers discussed the atypical child case, the delinquent boy, the district service plan in family welfare, etc. Considerable thought, by the health group, was given to the diagnostic clinic. There were in attendance some 500 persons. For 1926-27, William J. Shroder, of Cincinnati, was elected president. The 1927 conference was announced to take place in Des Moines, Ia. Other important developments in the Jewish field were: The assurance of a field service to be conducted by the Bureau of Jewish Social Research, the continued success of the *Jewish Social Service Quarterly*, and the opening of a community-wide survey of Jewish work in New York City. Something of the scope of the activity may be indicated by the fact that the survey is to cost \$200,000 and is to study every field of Jewish work.

**NON-LOCAL PHILANTHROPIES.** Another example of characteristic Jewish alertness in considering the administrative problems of welfare work was the proposed plan to form one national chest for all organizations making national and international appeals for funds. In a meeting held in November, in New York, and attended by Jewish leaders generally, it was decided that some measures were needed to control the financial operations of those organizations that made widespread appeals for funds. It was ascertained that there were some 40 Palestinian agencies and probably a score of American agencies, philanthropic and educational, that were raising in the neighborhood of \$2,500,000 annually among the Jews of the United States. In view of the fact that these were non-local philanthropic and educational enterprises, their financial and administrative affairs were beyond the control of local federations. It was the consensus of the original meeting that a study committee be appointed to report back on the feasibility of such a chest and the desirability of studying the whole problem. This committee, made up of Justice Irving Lehman, of New York, James H. Becker and Jacob M. Loeb, of Chicago, and William J. Shroder, of Cincinnati, was appointed. Consideration of the new chest plan was prompted in a measure by the success of the New York Jewish Federation, which raised \$4,700,000 in 1926 in a single campaign.

**INTERNATIONAL.** At Paris, on September 27, a meeting took place whose purpose was the

calling of an International Conference of Social Work. Dr. Alice Masaryk, of Czecho-Slovakia, presided, and social workers from 17 countries were in attendance. It was decided that the international conference be held in London in 1927 at the same time as the next International Congress of Public and Private Welfare. On the executive committee of the conference, the United States is represented by Barry C. Smith of the Commonwealth Fund and Miss Mary Van Kleeck of the Russell Sage Foundation.

**WELKER, PHILIP ALBERT.** American civil engineer and scientist, died at Washington, D. C., Dec. 24. He was born at Toledo, Ohio, June 1, 1857, and, graduating from Cornell University in civil engineering in 1878, was appointed to the U. S. Coast and Geodetic Survey in 1879. From 1898 to 1910, as commanding officer of the Coast and Geodetic Survey ship *Bache*, he carried out surveys along the coasts of the Atlantic Ocean and the Gulf of Mexico, as well as in the Caribbean Sea. He took part in astronomical expeditions which included observations of the transit of Venus in 1882, and of the annular eclipse of the sun in 1886. On the completion of his surveys in the Philippine Islands he returned to the United States to be in charge of the Survey office in Washington.

**WELLAND CANAL.** See CANALS.

**WELLESLEY COLLEGE.** A non-sectarian institution for the higher education of women at Wellesley, Mass.; founded in 1875. The enrollment for the fall term of 1926 was 1588, including 41 resident candidates for the degree of M.A., 29 for the certificate in hygiene and physical education, and 8 for the M.S. in hygiene and physical education. The actual teaching staff numbered 157, and the officers of instruction and government 231. The trust funds amounted to \$8,300,496, and the income for the year was \$902,989 (including dormitories' net). The new dormitory, Severance Hall, would be ready for occupancy in February, 1927, it was expected, and the new botany building, including lecture rooms and laboratories, in the spring. The library contained some 113,000 volumes. President, Ellen Fitz Pendleton, M.A., Litt.D., LL.D.

**WELLINGTON, CHARLES.** American chemist and educator, died at Amherst, Mass., November 15. He was born May 4, 1853, at Limerick, Maine, and was graduated from the Massachusetts College of Agriculture in 1873. In 1876-77 he was a student at the University of Virginia, and served as assistant chemist in the U. S. Department of Agriculture, 1877-82. He continued his studies at the University of Leipzig in 1882-83; and made special studies in Berlin and Paris in 1883, and at Göttingen in 1883-85. Returning to the United States, he became professor of chemistry at the Massachusetts Agricultural College in 1885, serving until 1923.

**WESLEYAN METHODIST CONNECTION OF AMERICA.** See METHODIST WESLEYAN CONNECTION OF AMERICA.

**WESLEYAN REFORM UNION.** See METHODISTS, WESLEYAN.

**WESLEYAN UNIVERSITY.** An institution for the higher education of men at Middletown, Conn.; founded in 1831. The 1926 fall enrollment was 607, the number of students having been restricted to approximately 500. The faculty numbered 63. The productive funds of the

university amounted to \$4,501,743, and the income for the year was \$506,055. The Hall Laboratory of Chemistry, started in 1925 and expected to cost more than one-third of a million dollars, was practically completed at the end of 1926, and the Olin Library, costing \$750,000, was under construction, to be completed in 1927. The library contained 153,000 volumes. President, James Lukens McConaughy, Ph.D.

**WESTERN AUSTRALIA.** A state of the Commonwealth of Australia, comprising that portion of the island continent which lies to the west of the Northern Territory and Southern Australia; the largest state in the Commonwealth, constituting almost one-third of the area of the continent. Area, estimated at 975,920 square miles; population, according to the census of 1921, 332,732; the full-blooded aborigines were estimated at 25,000 in 1922-23; estimated population of the state on March 31, 1926, 372,732. Capital, Perth, with an estimated population at the end of 1924, including suburbs, of 176,467. In 1925 the movement of population was: Births, 8185; deaths, 3315; marriages, 2746. In 1924, immigrants, 25,195; emigrants, 29,924. In the same year, the number of government schools was 789, with 51,726 students enrolled; the number of private schools was 117, with 11,336 students enrolled.

In 1925 the area under crops was 2,170,856 acres. The chief crops with their acreage and yield were: Wheat, 1,867,614 acres, 23,887,397 bushels; oats, 318,982 acres, 4,241,074 bushels; barley, 11,606 acres, 177,537 bushels; hay, 397,591 acres, 448,524 tons; potatoes, 5122 acres, 19,891 tons; vines, 5331 acres, 223,761 gallons of wine. In 1926 the estimated areas sown with wheat, oats, and barley were 2,397,105, 508,161, and 17,258, respectively. The sheep numbered 6,396,564, yielding 39,526,354 pounds of wool. The two leading minerals are coal and gold. In 1924, 485,035 fine ounces of gold were mined, valued at £2,060,298; 421,864 tons of coal mined were valued at £363,255. In 1924-25 imports were valued at £16,075,446 and exports at £14,664,548. The revenues for 1925-26 amounted to £8,808,166, against expenditures of £8,907,308. The deficit of the state, which has been accruing since 1912, amounted in 1926 to £6,200,000. To relieve the situation, the Federal government has offered to assist the state financially for a period of five years, proposing to take over that portion of the state north of the twenty-sixth parallel. If the state accepts the government's proposal and relinquishes its northern half, which is sparsely populated and causes the chief financial drag, the Federal ministry believes the outstanding difficulty remaining will then be the deficit. If this is provided for, the finances of the state will be placed on a sound basis. Operation of the Western Australian Railways for the year ended June 30, 1926, resulted in a deficit of £31,982, as compared with a surplus of £190,565 for 1924-25. The principal causes assigned for the difference between the deficit, and the surplus of the preceding year, are: Increase in rates of pay to staff and reduction in hours of work, £98,000; water haulage, £30,000; coal strike, £5000; increased interest bill, £48,000; reduction in freights and fares, £38,000; or a total of £217,000. Another factor which affected the year's finances was the reduced harvest. On June 30, 1926, the railway system comprised 3864 miles of main line (3 feet 6

inches) representing a capital expenditure of £21,026,792. Executive power is vested in a governor, who acts through a responsible ministry; and legislative power in a parliament of two houses, a council of 30 members elected for six years and an assembly of 50 members elected for three years. Governor in 1926, Lieut.-Col. Sir William Robert Campion; prime minister, colonial treasurer, and minister for forests, Philip Collier.

**WESTERN RESERVE UNIVERSITY.** A non-sectarian institution of higher education at Cleveland, Ohio; chartered in 1826. The enrollment for the autumn of 1926 was 3177, distributed as follows: Adelbert College, 886; college for women, 865; school of medicine, 222; law school, 269; pharmacy, 102, dentistry, 202; nursing, 264; library science, 63; graduate school, 259; school of applied social sciences, 160. The 1926 summer school, carried on in cooperation with the Cleveland School of Education, had a registration of 1693. In the autumn of 1926 the faculty numbered 408, 57 of whom were additions during the year. The endowment of the University was \$7,638,954, and the income for the year \$1,361,000. The library contained 190,600 volumes. In February, 1926, the University Foundation was formed, bringing together a number of the educational, philanthropic, and cultural agencies of Cleveland, each to be represented on a central board to act for the advantage of all. In September the School of Dentistry raised the requirements for admission to include at least two years of liberal arts. The graduate school was established as a separate college, with Elbert J. Benton, Ph.D., professor of history in Adelbert College, as dean. A. Caswell Ellis, Ph.D., formerly professor of the philosophy of education in the University of Texas, was chosen director of Cleveland College, which was made a college of the University, though still retaining its affiliation with the Case School of Applied Science. In November, 1926, the General Education Board granted to the University \$975,000, \$750,000 of which was to be used to build an Institute of Pathology to focus work of the School of Medicine and the University hospitals, the remainder to be granted to the School of Medicine for its general budget for three years. Adelbert College reverted from the honor system in examinations to a proctor system. President, Robert E. Vinson, D.D., LL.D.

**WEST POINT.** See UNITED STATES MILITARY ACADEMY.

**WEST VIRGINIA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,463,701. The estimated population on July 1, 1926, was 1,669,000. The capital is Charleston.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	771,000	1,015,000 *	\$19,691,000
	1925	836,000	1,005,000 *	20,100,000
Corn	1926	499,000	16,467,000	15,479,000
	1925	520,000	18,980,000	18,980,000
Potatoes	1926	47,000	4,982,000	8,320,000
	1925	47,000	4,089,000	7,892,000
Wheat, winter	1926	147,000	2,852,000	3,175,000
	1925	134,000	1,809,000	2,858,000
Oats	1926	207,000	5,796,000	8,420,000
	1925	188,000	5,076,000	8,147,000
Tobacco	1926	10,000	8,500,000 *	1,615,000
	1925	9,000	6,975,000 *	1,269,000

\* tons. \* pounds.

**MINERAL PRODUCTION.** The State maintained its rank in 1925 as second of the United States in total annual production of coal, its chief product. The production rose to 124,036,000 short tons in 1925, from 101,662,897 in 1924. Coal mined in 1924 was valued at \$185,229,000; in 1923, \$285,481,000. Connected with the coal industry there is an important production of coke and of pig iron. Coke was produced to the quantity of 1,328,569 short tons in 1924 and of 1,762,775 in 1923; and to a value of \$6,048,638 in 1924, and in 1923, \$11,103,718. Pig iron production was, in quantity, 499,047 long tons in 1925 and 453,944 in 1924; in value, \$9,416,095 in 1925 and in 1924, \$9,884,019. Natural gas production in the State was the third highest among the States in 1924 in point of quantity, while in value it ranked first. Of natural gas there were produced 182,285,000 M cubic feet in 1924 and 203,867,000 M cubic feet in 1923; in value, \$68,000,000 in 1924 and in 1923, \$69,981,000. Gasoline was made from natural gas to a total of 64,500,000 gallons in 1925, and in 1924 of 61,549,000 gallons; in value \$6,500,000 (estimated) in 1925 and in 1924, \$7,154,000. Petroleum production attained 5,776,000 barrels in 1925 and 5,920,000 in 1924; in value, \$20,300,000 (estimated) in 1925 and \$20,840,000 in 1924. Clay products of the State had a value in 1924 of \$15,625,022 and of \$17,574,096 in 1923. Stone, sand and gravel, and lime are produced in considerable quantities. The total value of the State's mineral product, duplications excluded, in 1924 was \$307,314,205; in 1923, \$412,866,635. The State held fourth rank among the States in 1924 as a mineral producer.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925, were \$10,979,627. Their per capita rate was \$6.91, as against \$6.34 in 1924 and \$2.72 in 1918. Their total included \$1,915,399 for education, apportioned among the minor State divisions. Payments amounting to \$1,803,996 for interest on debt, and of \$11,783,628 for permanent improvements, added to payments for maintenance and operation of the State departments, made the year's total of State payments \$24,567,251. For highways was expended the sum of \$11,122,397, of which \$1,754,077 was for maintenance and \$9,368,320 for construction.

Revenue receipts of the State were \$16,271,294, or \$10.24 per capita. They exceeded by \$3,487,671 the total payments except those for permanent improvements, and were \$8,295,957 less than the total with these included. Payments not covered by revenue receipts were met from proceeds of debt obligations. Property and special taxes formed 31.9 per cent of the revenue in 1925, as against 30.3 per cent in 1924 and 43.4 per cent in 1918. Their per capita rate was \$3.27 in 1925, \$3.05 in 1924 and \$1.76 in 1918. Earnings of the departments and compensation for officials' services furnished 8 per cent of the 1925 revenue; business and non-business licenses, 51.4 per cent. License receipts included those from taxes on incorporated companies, on sales of gasoline and on motor vehicles.

The net indebtedness of the State on June 30, 1925, was \$38,407,571, or \$24.18 per capita, against \$23.03 in 1924 and no indebtedness in 1918. The assessed valuation of property subject to State tax was \$2,133,491,140. The State

tax levy was \$2,986,888, or \$1.88 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 4038. There were constructed in 1926 some 2 miles of new first track and 9 miles of second track.

**EDUCATION.** The commission on high-school curriculum headed by Professor Lakin F. Roberts completed its task. Studies of college curricula were made by J. Frank Marsh; on the financing of education in the State, by L. V. Cavins; and, by the same author, on teachers' qualifications and salaries. A commentator in the *Journal of the National Education Association* marked a growth of public opinion in favor of an approach to equalization of educational opportunities and to the implied alteration in the distribution of the burden of school support.

**CHARITIES AND CORRECTIONS.** The State Board of Control holds full direction of all State penal and charitable institutions and in addition controls the finances and business of State educational institutions. The institutions (except educational) under its authority, with their inmate population on Nov. 30, 1926, were as follows:

Weston State Hospital (insane, white) .....	1160
Weston State Hospital (insane, colored) .....	54
Spencer State Hospital (insane) .....	749
Huntington State Hospital (mental) .....	966
State Hospital for Colored Insane .....	211
State Tuberculosis Sanitarium .....	314
State Colored Tuberculosis Sanitarium .....	50
Welch Hospital No. 1 (surgical) .....	51
McKendree Hospital No. 2 (surgical) .....	47
Fairmont Hospital No. 3 (surgical) .....	61
West Virginia Industrial School for Boys .....	416
State Industrial School for Colored Boys .....	67
West Virginia Industrial Home for Girls .....	128
State Industrial Home for Colored Girls .....	23
West Virginia Children's Home .....	38
West Virginia Colored Orphans' Home .....	13
Home for Aged and Infirm Colored Men and Women .....	30
West Virginia Penitentiary .....	1790

The State Hospital for the Colored Insane was put in operation in the course of the year.

**POLITICAL AND OTHER EVENTS.** The industrial year passed with relatively few serious labor incidents. The United Mine Workers sought in the State courts an injunction to prevent four coal-mining companies from operating in alleged violation of a union agreement. The injunction was refused, June 9, and the United Mine Workers subsequently sought impeachment of Judge I. G. Lazzelle, on charges connected with his refusal to enjoin.

There were elected, November 2, as Representatives to the 70th Congress, 5 Republicans and 1 Democrat.

**OFFICERS.** Governor, Howard M. Gore; Secretary of State, George W. Sharp; Treasurer, W. S. Johnson; Acting Auditor, G. W. Sharp; Attorney-General, Howard B. Lee; State Superintendent of Free Schools, George M. Ford; Commissioner of Agriculture, John W. Smith.

**JUDICIARY.** Supreme Court: President, M. O. Litz; Associate Judges, W. N. Miller, Frank Lively, John H. Hatcher, Homer B. Woods.

**WEST VIRGINIA UNIVERSITY.** A co-educational institution of higher education at Morgantown, W. Va.; founded in 1867. The 1926 fall enrollment was 2600, of whom 1800 were men and 800 women. There were 686 registered in the summer school. The faculty numbered more than 300 including 73 professors, 20 associate professors, and 42 assistant professors. The

libraries contained 92,000 volumes. During the year a new chemistry building was completed at a cost of \$911,424, and a women's gymnasium was in process of construction, to cost \$272,000. President, Frank Butler Trotter, LL.D.

**WHEAT.** A review of the world's wheat situation by the International Institute of Agriculture, Rome, estimated the quantity of wheat available for export during the year beginning Aug. 1, 1926, at 880,000,000 bushels and the probable requirements of importing countries for the same period at over 100,000,000 bushels less, thus assuring adequate supplies and a fairly large carry-over at the end of the year. The total production in 1926 of 36 countries reporting, not including the Soviet republics, was estimated at 3,091,990,500 bushels as compared with 3,039,060,900 in 1925. The yields of leading countries were given as follows, in bushels: Canada, 405,814,000; India, 324,949,300; France, 248,602,800; Italy, 221,009,700; Spain, 157,338,800; Germany, 112,191,700; and Rumania, 110,881,900 bushels. The production of the Soviet republics in 1925 was reported as 577,071,900 bushels. The yield of Argentina for the crop year 1926-27 was provisionally estimated at 215,316,000 bushels, and the yield of Australia at 150,000,000 bushels.

The wheat production of the United States in 1926 was estimated by the Department of Agriculture at 832,305,000 bushels, the area at 56,526,000 acres and the average yield per acre at 14.7 bushels. In 1925 the yield was 676,429,000 bushels, the area 52,255,000 acres and the average yield 12.9 bushels per acre. The average farm value Dec. 1, 1926, was \$1.199 per bushel, as against \$1.415 per bushel Dec. 1, 1925. On this basis the total value of the crop in 1926 was \$997,589,000 and of the crop in 1925 \$957,907,000. Of the total wheat area in 1926, 36,913,000 acres were in winter wheat and 19,613,000 acres in spring wheat. The production of winter wheat was 626,929,000 bushels, at the rate of 17 bushels per acre, and of spring wheat 205,376,000 bushels, at the rate of 10.5 bushels per acre. The spring wheat production includes 44,826,000 bushels of durum wheat, which was 16,825,000 less than in 1925. The average yield per acre of durum wheat in 1926 was 9.2 bushels per acre.

The production of durum wheat in the four leading States was as follows, in bushels: North Dakota, 36,138,000; South Dakota, 4,896,000; Minnesota, 3,276,000; and Montana, 516,000. The yields of winter wheat in the leading States of the 39 States reporting in 1926 were as follows, in bushels: Kansas, 150,057,000; Oklahoma, 73,745,000; Ohio, 40,252,000; Illinois, 38,934,000; Nebraska, 37,165,000; and Indiana, 33,940,000. In acreage, Kansas ranked first with 10,139,000 acres, followed by Oklahoma with 4,214,000, Nebraska with 2,881,000, and Illinois with 2,163,000. All other States had less than 2,000,000 acres each. Of the 24 States reporting spring wheat production, the leading States and their yields were as follows, in bushels: North Dakota, 77,224,000; Montana, 38,393,000; Minnesota, 24,588,000; Washington, 20,790,000; and Idaho, 14,352,000. In acreage, North Dakota ranked first with 9,653,000 acres, followed by Montana with 3,147,000, Minnesota with 1,967,000, South Dakota with 1,842,000, and Washington with 1,260,000.

During the year ended June 30, 1926, the United States exported 63,000,000 bushels of wheat and, in addition, 45,000,000 bushels as flour. For the flour exported, 13,000,000 bushels were imported from Canada in bond and 2,000,000 bushels on which duty was paid, making the net exports approximately 93,000,000 bushels. The 63,000,000 bushels exported as grain consisted of about 10,000,000 bushels of hard red spring, 21,000,000 durum, 11,000,000 hard red winter, 3,000,000 soft red winter and 18,000,000 white wheat. A large part of the exports of all classes except durum was from the Pacific Coast States. The reduction in the European wheat crops of 1926 was largely offset by the increase in yield over the preceding year in the United States. The government procurement of grain in the Soviet republics for the use of the deficit producing areas, the cities and for export was continued, and the grain movement out of the country, largely wheat, was reported as greater than a year ago.

Studies made by the United States Department of Agriculture showed that the cost of producing an acre of wheat on all farms reporting varied from \$19.68 in 1922 to \$22.41 in 1925 and that the cost per bushel in 1925 was \$1.32, or from 8 cents to 10 cents per bushel more than during the previous three years. The bushel cost of production in 1925 in the different groups of States varied as follows: North Atlantic, \$1.32; South Atlantic, \$1.50; East North Central, \$1.29; West North Central, \$1.23; South Central, \$1.49; and Western, \$1.19. During the year ended June 30, 1926, 444,403 carloads of wheat were inspected on arrival at all inspection points by inspectors licensed under the United States grain standards act. A new quarantine against flag smut of wheat, effective Feb. 1, 1926, prohibited the importation of wheat and wheat products from the countries in which flag smut prevails unless milled or processed to destroy all flag smut spores.

Although the position of the United States was more favorable with regard to world market conditions than in 1925, the price of wheat during the fall of 1926 was lower, and lower premiums were paid for high-protein wheat. At Minneapolis, the premium for 13 per cent protein wheat was only 4 cents per bushel, while the year before it was 20 cents, and test weight and moisture content were considered more important than protein content. Consult "Relation of Kernel Texture to the Physical Characteristics, Milling and Baking Qualities and Chemical Composition of Wheat" *Department Bulletin* No. 1420-D, United States Department of Agriculture (Washington, 1926). "Wheat and Rye Statistics" *Statistical Bulletin* No. 12, United States Department of Agriculture (Washington, 1926).

**WHEAT DISEASES.** See BOTANY, under *Plant Diseases*.

**WHITEHEAD,** CHARLES NELSON. American railroad president, died at St. Louis, Mo., Dec. 10. He was born Jan. 23, 1878, at Princeton, Ill. At 14 he was a messenger in the freight office of the St. Louis Southwestern R. R., at Cairo, Ill. The family moved soon afterward to Texas, and in 1895 Mr. Whitehead began his long connection with the Missouri-Kansas-Texas Railroad. After holding many minor positions, he became vice president in 1914. At the receivership in 1915, he was appointed assist-

ant to the receiver, and during the period of Government control he was general manager and Federal manager of the Missouri-Kansas-Texas lines north of the Red River. He was, next, chief operating officer for the receiver, until the reorganization in 1922, when he was made executive vice president. In May, 1926, he succeeded Charles F. Schaff as president of the railroad.

**WHITE PINE BLISTER RUST.** See BOTANY under *Plant Diseases*.

**WHITE PLAINS, BATTLE OF.** See CELEBRATIONS.

**WIEDFELDT, OTTO.** German industrialist and diplomat, died at Essen, July 5. He was born in Germany in 1871, the son of a successful manufacturer, and in his education specialized in law and economics. After being employed in the ministry of the interior, he went to Japan, where he represented large German concerns. He also filled the post of commercial adviser to the Japanese Government. On his return from Japan in 1914, Dr. Wiedfeldt spent several months in the United States, and soon after the outbreak of the World War he took up an important position in the office of the Reich Wirtschaft. He instituted the bread-rationing system, and remained bread administrator until June, 1918, when he became a director of Krupp's. After the War he began the gigantic task of reorganizing this plant for peace production. He was a delegate to the Spa Conference of 1920, where he and the late Hugo Stinnes opposed strongly the delivery of coal as part of the reparation to be demanded by the peace treaty. He was appointed German Ambassador to the United States, in which capacity he served from 1922 to 1925.

**WILCOX, MARRION.** American author and editor, died in New York, N. Y., Dec. 26. He was born Apr. 3, 1858, at Augusta, Ga., and graduated from Yale in 1878. Two years later he was admitted to the New York bar, studying law at Hamilton College. He prosecuted special studies in Europe at the universities of Oxford, Jena, Heidelberg, and Berlin, from 1881 to 1883, and served as an instructor at Yale University, 1884-86. In 1906-07 he visited Mexico and South America, and on his visit in 1907, at the request of Yale University, he suggested an interchange of professors between the United States and South American countries, stressing particularly the need for such interchange with Mexico, Brazil, and Argentina. He was the author of *A Short History of the War with Spain*; *Harper's History of the War in the Philippines* (1900), *Sketches in Spain, England and Italy*, and a novel, *For Labour* (1923).

**WILFLEY, LEBREUS REDMAN.** American jurist and judge, died at Greenwich, Conn., May 26. He was born in Audrain County, Mo., Mar. 30, 1866, and graduated from the Central College at Fayette, Mo., in 1880. In 1892 he received the degree of LL.B. at Yale, and in the following year he was admitted to the bar. From this time until 1901 he engaged in general practice at St. Louis, Mo., and from 1901 to 1906 he was attorney general for the Philippine Islands. In 1904 he was United States delegate to the Universal Congress of Lawyers and Jurists, at St. Louis, and from 1906 to 1909 he was a judge of the United States court for China.

**WILLCOCKS, SIR JAMES.** British soldier and former Governor General of Bermuda, died Dec.

18, at Bhartapur, India. He was born in 1857 in Delhi, India, and from 1879 to 1908 he was an active participant in many of the important campaigns of the British forces in India and West Africa. At the beginning of the World War he was chosen to command the large force of Indian troops sent to France. This command he resigned in December, 1915, and in 1917 he was appointed Governor General of Bermuda, where he remained until 1922. In 1918, Amherst College, in Massachusetts, conferred upon him the honorary degree of Doctor of Laws. He received his knighthood in 1900 for conspicuous devotion to duty and gallantry in face of the enemy's fire. Among his numerous decorations was the Distinguished Service Order, and he also received the freedom of the City of London, and a sword of honor. During his Governor Generalship, Bermuda returned to pre-war prosperity.

**WILLIAM AND MARY, COLLEGE OF.** A coeducational college at Williamsburg, Va.; founded in 1693. The enrollment for the fall semester of 1926 was 1003, of whom 477 were women and 526 were men. The summer session of 1926 had 800 students. There were 65 members in the faculty, an increase of nine over 1925. The college had productive funds to the amount of \$55,390, and the income for the year was \$1,091,254. The library contained 49,000 volumes. During the year gifts to the amount of \$212,415 were received, and three new buildings, Kate Waller Barrett dormitory for girls, William Barton Rogers Science Hall, and Old Dominion Hall for men, were erected. President, Julian A. C. Chandler, Ph.D.

**WILLIAMS, JOHN SKELTON.** American banker, died at Richmond, Va., November 4. He was born in Powhatan Co., Va., July 6, 1865, and was educated at Richmond schools and at the University of Virginia. He saw the need for another great coastal railroad, and organized the Seaboard Air Line, acting as its president from 1899 to 1904. He was almost constantly in conflict, having many differences on questions of policy with the American Bankers' Association. He also was in controversy with the Riggs National Bank of Washington, one of the largest financial institutions in the East, and he issued vigorous criticisms of the Federal Reserve Board. In 1914, strongly supported by Secretary of the Treasury McAdoo, Mr. Williams was appointed by President Wilson to be controller of the currency, but his confirmation was opposed in the Senate. The Senate committee's report completely vindicated Mr. Williams, and he was duly confirmed, becoming ex officio a member of the organization committee of the Federal Reserve Board. He was reappointed in 1919, but on this occasion failed of confirmation. In 1917-18 he served as director of finance and purchases for the United States Railroad Administration. In 1924 he became president of the Richmond Trust Company, a position he held at the time of his death.

**WILLIAMS COLLEGE.** A non-sectarian college for men at Williamstown, Mass.; founded in 1793. The enrollment for the autumn of 1926 was 781, of whom 774 were undergraduates and 7 graduate students. There were 81 members on the faculty, of whom four were absent on leave and 16 were new additions. The productive funds amounted to \$5,315,955 and the income for the year 1925-26 was \$585,945. The

library contained 116,000 volumes and 20,000 pamphlets. During the year a new field house was built, and Lawrence Hall was remodeled for recitations. A system by which juniors and seniors of good scholarship are permitted to do "honors work" in the department of their choice was inaugurated in 1926. President, Harry Augustus Garfield, L.H.D., LL.D.

**WILSON AWARD.** See WOODROW WILSON AWARD.

**WILSON DAM.** See MUSCLE SHOALS.

**WINDWARD ISLANDS.** The name applied to a group of islands in the West Indies, comprising Grenada, St. Vincent, and St. Lucia, together with the Grenadines (which are one-half under Grenada and one-half under St. Vincent); forming the eastern limit of the Caribbean Sea between Martinique and Trinidad; a British possession. (See articles on the islands mentioned above.) Each of the islands is under its own institutions, but they are united for certain common purposes and have a court of appeals. Governor and commander-in-chief in 1926, Sir Frederick Seton James.

**WIRELESS TELEGRAPHY.** See RADIO TELEGRAPHY AND TELEPHONY.

**WISCONSIN. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,632,067. The estimated population on July 1, 1926, was 2,885,000. The capital is Madison.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	3,368,000	5,742,000 <sup>a</sup>	\$86,130,000
	1925	3,362,000	5,486,000 <sup>a</sup>	76,804,000
Corn	1926	2,119,000	73,106,000	54,830,000
	1925	2,185,000	101,602,000	73,153,000
Oats	1926	2,577,000	96,638,000	38,655,000
	1925	2,603,000	126,246,000	47,973,000
Potatoes	1926	230,000	27,140,000	32,568,000
	1925	211,000	23,632,000	40,174,000
Barley	1926	521,000	17,974,000	11,683,000
	1925	461,000	16,965,000	11,197,000
Rye	1926	256,000	3,840,000	3,226,000
	1925	256,000	3,789,000	2,880,000
Tobacco	1926	29,000	33,350,000 <sup>b</sup>	4,269,000
	1925	32,000	44,000,000 <sup>b</sup>	7,260,000
Wheat, winter	1926	65,000	1,339,000	1,674,000
	1925	53,000	1,007,000	1,370,000
Wheat, spring	1926	63,000	1,260,000	1,588,000
	1925	60,000	1,260,000	1,714,000

<sup>a</sup> tons. <sup>b</sup> pounds.

**MINERAL PRODUCTION.** Stone, the chief of the State's mineral products, was produced to the quantity of 2,221,910 short tons in 1924 and 2,488,180 in 1923; valued at \$4,087,133 for 1924 and for 1923 at \$4,590,528. Iron ore, 933,214 long tons in 1925 and 786,006 in 1924, had a value of \$2,260,388 in 1925 and in 1924 of \$2,044,762. Pig iron production rose to 226,712 long tons for 1925 from 172,435 for 1924; its value was \$4,830,952 in 1925 and in 1924, \$3,945,369. Sand and gravel production amounted to 5,713,956 short tons in 1924 and 5,021,608 in 1923; in value, \$2,703,475 in 1924 and in 1923, \$2,793,999. The lime produced totaled 243,000 short tons (estimated) in 1925 as against 235,030 in 1924; its value was \$2,140,000 (estimated) for 1925 and for 1924, \$2,129,701. Zinc, clay products, lead, and manganiferous ore were produced. The total value of the State's mineral production, duplications excluded, was in 1924, \$15,796,720; in 1923, \$19,089,600.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State in the fiscal year ending June 30, 1925, were \$26,381,205. Their rate per capita was \$9.47, as against \$9.20 in 1924 and \$6.04 in 1918. Their total included \$4,859,583 for education, apportioned among the minor State divisions. Payments amounting to \$137,459 for interest on debt and \$5,480,068 for permanent improvements, added to payments for maintenance and operation of the State departments, made the year's total of State payments \$31,998,732. For highways was expended the sum of \$7,096,956, of which \$3,581,472 was for maintenance and \$3,515,484 for construction.

Revenue receipts of the State were \$30,502,615, or \$13.10 per capita. They exceeded by \$9,983,951 the total payments except those for permanent improvements, and, furthermore, exceeded by \$4,503,883 the total with these included. Revenue not otherwise used was invested or carried in the State's cash balances. Property and special taxes formed 51.8 per cent of the revenue in 1925, as against 53.1 in 1924 and 62.5 in 1918. Their per capita rate was \$6.79 in 1925, \$7.25 in 1924 and \$4.40 in 1918. Earnings of the departments and compensation for officials' services furnished 9.1 per cent of the 1925 revenue; business and non-business licensees, 25.8 per cent. License receipts included those from taxes on corporations, on gasoline sales and on motor vehicles.

The net indebtedness of the State on June 30, 1925, was \$1,863,700, or 67 cents per capita; in 1924, 71 cents and in 1918, 76 cents. The assessed valuation of property subject to State tax in 1925 was \$5,448,977,317. The State tax levy was \$15,067,064, or \$5.41 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 7500. No new construction was reported in 1926. The Chicago, Milwaukee and St. Paul abandoned lines between Tomah and Norway and between Wausaukee and Girard Junction, totaling 30 miles. The Fairchild and Northeastern abandoned 42 miles of line in 2 stretches between Fairchild and Cleghorn and between Greenwood and Owen.

**EDUCATION.** It was announced that under the new requirements no license or certificate to teach in a public school of the State would be granted after September, 1927, to any person unless presenting as qualification at least one year of professional training subsequent to high-school graduation. The county rural normal schools and high-school training departments adopted the practice of enrolling high-school graduates only. Very heavy growth of summer-school attendance was reported, with increase likewise of interest in the profession of teaching. The school population of the State in the scholastic year 1925-1926 was 877,792. There were enrolled in the public schools 513,456 pupils, of whom 413,875 were in the common schools and 99,581 in the high schools. Expenditures for the common schools attained \$49,482,939. Salaries of teachers averaged about \$1350 per annum.

**CHARITIES AND CORRECTIONS.** The chief among the charitable and correctional institutions of the State are two hospitals for the insane, the industrial school for boys and the one for girls, the State prison, State reformatories, sanitariums, and the Wisconsin workshop for the blind.

The State board of control has authority over charitable and penal institutions.

**POLITICAL AND OTHER EVENTS.** At the general election, November 2, F. R. Zimmerman, Republican, was elected Governor, over a divided opposition, which included Charles Perry, Independent Republican, and the Democratic candidate, V. H. Cady. Gov. John J. Blaine, the Republican candidate for Senator, had 6 opponents, of whom Charles D. Rosa, Independent candidate, was the most formidable. Blaine was elected to the six-year term in the U. S. Senate; ten Republicans and 1 Socialist, Victor L. Berger, were elected to the United States House of Representatives. A State referendum to determine the wishes of the electorate as to a modification of the Volstead law so as to permit sale of beer of 2.75 per cent alcohol content was submitted to the voters, who gave a decisive majority in favor of modifying the law.

State officers elected for the ensuing term were Henry A. Huber, Lieutenant-Governor; Theodore Dammann, Secretary of State; Solomon Levitan, Treasurer; John W. Reynolds, Attorney General. A referendum proposal for the recall of State officers received a majority vote of 4743.

The Wisconsin law providing that all transfers of property made within six years prior to the death of a donor, in which no valuable consideration enters, must be construed as having been made in contemplation of death and with a view to evading payment of inheritance tax, was set aside as invalid in an opinion by Associate Justice McReynolds rendered March 1 by the United States Supreme Court. A decision by the Wisconsin courts upholding the State law was reversed. The Milwaukee zoning ordinance was upheld by the Wisconsin Supreme Court, December 7, in a decision sustaining the city authorities' refusal to allow erection of an apartment house.

**OFFICERS.** Governor, John J. Blaine; Lieutenant-Governor, Henry A. Huber; Secretary of State and State Auditor, Fred R. Zimmerman; Treasurer, Solomon Levitan; Attorney-General, Herman L. Ekern; Superintendent of Schools, John Callahan.

**JUDICIARY.** Supreme Court: Chief Justice, Aad. J. Vinje; Associate Justices, Marvin B. Rosenberry, Franz C. Eschweiler, Walter C. Owen, Christian Doerfler, Charles H. Crownhart, and E. Ray Stevens.

**WISCONSIN, UNIVERSITY OF.** A State institution of higher education at Madison, Wis.; founded in 1848. The enrollment for the autumn of 1926 was 8220, distributed as follows: Letters and science, 5945; music, 136; medicine, 249; law, 256; engineering, 926; agriculture, 678; library, 30. For the summer session the registration totaled 5060, with the following distribution: Letters and science, 4323 (including medicine); music, 44; law, 110; engineering, 226; agriculture and home economics, 309; library, 48. In the autumn of 1926 the faculty numbered 1124, of whom 270 were additions. The productive funds amounted to \$864,066, and the income for the year to \$8,951,340. The library contained 735,000 volumes and 376,000 pamphlets. New buildings completed during the year were nurses' dormitories, men's dormitories, and an addition to Bascom Hall. The Union Memorial Building was under construction. Gifts to

the amount of \$73,702 were received for the Union Memorial Building Fund. The medical school course was lengthened to four years, granting the degree of M.D. President, Glenn Frank, M.A., L.H.D., Litt.D., LL.D.

**WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL.** A non-partisan and non-sectarian national movement which has as its purpose the protection of the homes by the abolition of the liquor traffic. It has branches in every State in the Union, and in the District of Columbia, Alaska, Hawaii, Canal Zone, Porto Rico, and the Philippines. Under the motto, "For God and Home and Every Land," it conducts activities in every line of service in the home and in social and civic life. A young people's branch comprises both young men and women united for temperance and prohibition. It issues a monthly *Bulletin* containing news and items of general interest. The official organ of the Union is *The Union Signal*. *The Young Crusader* is devoted to boys and girls. The officers in 1926 were: President, Miss Anna A. Gordon; vice-president at large, Mrs. Ida B. Wise Smith; corresponding secretary, Mrs. Frances P. Parks; recording secretary, Mrs. Sara M. Hoge; assistant recording secretary, Mrs. Welle G. Burger; treasurer, Mrs. Margaret C. Munns. The main headquarters are at Evanston, Ill.; the legislative headquarters at 122 Maryland Ave., N. E., Washington, D. C.

**WOMEN IN INDUSTRY.** The tenth annual convention of the National Women's Trade Union League was held at Kansas City, June 28-July 3. Miss Rose Schneiderman was elected president for the next year, and Mrs. Raymond Robbins was chosen honorary president. The convention stressed the need of educational work and organization in the new industrial South, where large numbers of women were employed as textile operators. It also urged the collection and publication, by the State departments of labor, of monthly statistics of employment and earnings of women in industry. The publication of such figures, it was held, would have a regulative effect upon employment.

An appeal was made to the President, the national Congress, the Governors and state legislatures, requesting the right to organize for women in industry and for legislation granting an eight-hour day and one day's rest in seven.

In its Federal legislative programme the league put the ratification of the proposed child-labor amendment as of first consideration. The convention voiced its opposition to another proposed amendment—namely, that championed by the National Woman's Party and providing for equal treatment of men and women in industry. The convention believed that what was needed was the protection of women in industry, and not an equal bill of rights in the Constitution.

The controversy over the equal rights amendment came up to plague the Women's Bureau of the Department of Labor in its preliminaries for an investigation of the effects of special legislation on the employment of women in industry. A resolution calling for such an investigation had been passed at the Women's Industrial Conference, which was convoked in January under the auspices of the Women's Bureau. Thereupon the bureau undertook the formation of an advisory committee composed of one representative each from the American Federation of Labor, the National Women's Trade Union League, and the Women's Committee Opposing the So-Called

"Equal Rights" Amendment; and of three representatives from the National Woman's Party, which is opposed to special legislation and champions the equal rights amendment. After a number of meetings, the first three delegates resigned because they felt they could no longer serve to good purpose with the other members of the committee. Despite their withdrawals, these delegates offered the full coöperation of their organizations towards the completion of the Women's Bureau investigation. But, unfortunately, as the chief of the bureau, Miss Mary Anderson, remarked in her annual report, similar coöperation was refused by the other delegates; that is to say, by the delegates opposed to special legislation with regard to women in industry. The bureau's agents, however, in conducting the field investigations, made every effort to get in touch with individuals and groups opposed to such legislation, "so that the facts of their experience may be recorded and examined."

The investigation was not completed in 1926, and its results would not be made known for some time. Other important investigations carried on by the Women's Bureau during the year related to night work for women, changing jobs, lost time and labor turnover, the status of women in the government service, and foreign-born women in industry. A piece of historical research on the history, operation, and administration of the various minimum wage laws in the United States was completed for publication at the end of the year.

#### WOMEN'S ATHLETIC COMPETITIONS.

See ATHLETICS, TRACK AND FIELD.

#### WOMEN'S CLUBS, GENERAL FEDERATION OF.

An organization founded in 1889 and chartered by Act of Congress Mar. 3, 1901. It is composed of local clubs in the United States and other countries, and its purpose is "The Betterment of Life." In addition to local clubs there were, in 1926, seventeen national organizations and fifty-seven clubs in foreign and territorial countries affiliated with the Federation. It is governed by a General Board and the work is divided into eight departments: American citizenship; the American home; education; fine arts; international relations; legislation; press and publicity; and public welfare. Other activities, not in departments, are: Federation extension through the organization of clubs in rural districts and the organization of juniors in senior clubs; contact with clubs and organizations in other countries; medical scholarship loan; Pan-American scholarship. In 1926 there were in all 125 activities sponsored by the Federation and conducted through the local and State federations, the most important being a survey of adult illiteracy with a view to its elimination. The official organ is the *General Federation News*. Headquarters are at 1734 N Street, N. W., Washington, D. C. Mrs. John D. Sherman was president and Miss Josephine Junkin director of headquarters.

**WOOD, CHARLES.** British composer, died in London, in July. He was born at Armagh, Ireland, June 15, 1866. After graduation from the Royal College of Music he taught for a time. In 1888-94 he was conductor of the Cambridge University Musical Society, and in 1889-97 bandmaster of the university volunteers. In 1924 he succeeded Sir Charles Stanford as professor of music at Cambridge University. Although his compositions are highly esteemed in England,

and have figured extensively on the programmes of all the great English festivals, they are practically unknown outside the British Isles. He wrote chiefly cantatas and ballads for soli, chorus and orchestra but also, a piano concerto and some chamber music.

**WOOD, FRANCIS DERWENT.** British sculptor, died February 19. He was born at Keswick, England, in 1871, and was educated in Switzerland and Germany. He began his artistic career at Karlsruhe, Germany, and returning to England in 1889 he studied under Professor Lanteri at South Kensington, London. He was a Royal Academy student, and in the years 1894-95 was assistant to Thomas Brock, R.A., becoming a gold medalist of the Royal Academy in 1895. In the same year he gained a traveling studentship from the academy, and two years later he won an award at the Paris Salon. He was made an Associate of the Royal Academy in 1910, and in 1920 he became a full Royal Academician. During the World War he supervised the making of masks for facial wounds. He was professor of sculpture at the Royal College of Art, South Kensington. His principal works include a statue of Queen Victoria, executed for Patiala, in India; a statue of Sir Titus Salt, Saltaire, and a statue of the Rev. Dr. C. H. Spurgeon placed before the Baptist Church House in London. In 1914 he made a bust of Henry James. He also executed four statues of the arts for the Glasgow Art Galleries, Scotland, and the Pitt statue for Washington, to celebrate the hundred years' peace.

**WOOD, WILLIAM MADISON.** American woolen manufacturer, died Feb. 2. He was born Apr. 5, 1858, at Edgartown, Mass., and was educated at the public schools. He began as a clerk in the office of the Wamsutta Mills, and later interested himself in banking and brokerage and other businesses. He joined in a merger of woolen mills in 1900, and later became president of the American Woolen Co., then comprising 28 mills. He was also president of the Woolen and Worsted Mills, Inc., the Shawshen Mills, the Washington Mills, in Lawrence, Mass., the National and Providence Worsted Mills, Rhode Island, and of the Kilburn Mills. He was also a director of the Merchants' National Bank, of the Chase National Bank, New York, and other corporations.

**WOOD PULP.** See FORESTRY; PAPER.

**WOODROW WILSON AWARD.** To Elihu Root was awarded the Woodrow Wilson Foundation Medal for 1926 and \$25,000, for his services in helping to create the World Court. Although the services were rendered in 1920, the Foundation was influenced in this instance by the manifestation of their importance shown in the growing prestige of the World Court. Norman Davis, the President of the Foundation, said: "Mr. Root's ambition for world peace has long been manifested. When the Council of the League of Nations in 1920 requested a committee of ten men to draw up a protocol for the establishment of a permanent court of international justice, Mr. Root was one of those chosen. Previously, in the year 1907, Mr. Root as Secretary of State, had formulated the instructions to the American delegates to the second Hague conference. Mr. Root in 1920 solved the difficulty that arose at The Hague conference over the election of Judges for a World Court. He recommended the plan that the nominations be made from the different groups of nationals represented at The Hague

tribunal and that these nominations be voted upon by an electoral college composed of the Council and the Assembly of the League of Nations."

Mr. Root received the award and medal at the dinner of the Woodrow Wilson Foundation in New York, December 28, given in celebration of Woodrow's Wilson's 70th birthday and presented the same to *Foreign Affairs* (a quarterly) to be used as the nucleus of an endowment fund.

**WOOL.** The sheep industry in 1926 enjoyed its fifth consecutive prosperous year, the prices encouraging expansion, notably in areas especially suited to it. World stocks of old wool were reduced to a low point at the end of the last season, which was favorable. Prices declined during the first two-thirds of the year, but later advanced sharply. The wool clip of 1926, as estimated by the Department of Agriculture, was 269,054,000 pounds, compared with 253,907,000 in 1925, an increase of more than 15,000,000. The average weight of fleece was 7.8 pounds in both years. Texas produced the largest amount, 25,804,000 pounds, followed by Wyoming with 24,132,000, Montana with 23,100,000, and Utah with 20,322,000 pounds. Approximately two-thirds of the clip was supplied by the Western group of States, exclusive of Texas.

Australia was the greatest sheep and wool producing country, furnishing an average of 23 per cent of the world's wool supply during 1920-24. The 1925-26 wool clip of that country amounted to 770,000,000 pounds, and it was estimated to be a little larger for 1926-27, although earlier predictions were cut by severe stock losses, through drought, in Queensland. Increased wool production was also indicated for Argentina; it was estimated at between 305,000 and 310,000 bales.

The production of mohair in Turkey appeared to be in a very strong position and on the increase; over 37,000 bags of 200 pounds each were sold in Constantinople up to October, as compared with a total of 14,000 bags in 1925.

A Wool Council of America was formed in Boston, to regain the ground lost to the silk and rayon industries in demand for cloth made from wool. The Eastern Wool Growers' Association, Inc., was formed, with headquarters at Baltimore; it was expected to market more than a half million pounds of wool during the year. A wool breeding council was appointed in England to encourage the improvement of wool, which varies widely in quality. Italian synthetic wool (see *CHEMISTRY, INDUSTRIAL*), which was placed upon the market, did not replace wool but was inferior, according to experts; however, fear was expressed that it might be used to adulterate pure wool. Twelve United States grades for wool and top, based on the numerical count system, were unanimously approved by all branches of the wool industry in April, in place of seven formerly recognized. The standards have been approved by the British wool trade, and their adoption is under consideration by other European and by South American countries. See *LIVESTOCK*.

**WORCESTER POLYTECHNIC INSTITUTE.** A non-sectarian institution for the technical education of men at Worcester, Mass.; founded in 1865. The enrollment for the autumn of 1926 totaled 567, distributed as follows: Studying mechanical engineering, 102; in civil engineering, 63; in chemistry, 39; in general

science, 3; in electrical engineering, 177; and 183 freshmen, all of whom take the same course of study. The faculty numbered 57. The productive funds of the institute amounted to \$2,612,000, and the income for the year to \$308,000. There were 20,000 volumes in the library. The principal addition received during the year was a new swimming pool, given by Henry J. Fuller and J. E. Aldred; and a hydraulic laboratory, given by George I. Alden, was completed. Other new buildings completed in 1926 were a garage and athletic storage building, and a field house on the athletic field. Sanford Riley Hall, a freshman dormitory, was under construction. President, Ralph Earle, Captain, U.S.N., retired, D.Sc., D.Eng.

**WORKMEN'S COMPENSATION.** With the ratification by popular referendum of the Missouri workmen's compensation act, only five states and the District of Columbia remained at the close of the year 1926 without this form of protection against industrial accidents and injuries. These five states are all in the non-industrial South. Seven states, including New York, Massachusetts, and Rhode Island, increased the protection of the compensation laws, and New Jersey added radium necrosis to the list of compensable industrial diseases. The Federal government provided increased medical assistance (under the accident compensation law) for its civilian employees. Commissions to study the operation of existing workmen's compensation laws and to recommend new legislation were established by Massachusetts, Rhode Island, and Virginia. The New York legislature (partly with the political purpose of postponing the redemption of campaign pledges) created a commission with authority to investigate generally conditions and legislation affecting the safety and welfare of wage workers.

Against this credit side of the ledger must be put the failure of Congress to pass the proposed bill affording compensation protection to harbor workers and longshoremen. This class of workers cannot be protected by State laws, since their calling—exceptionally hazardous though it is—falls within interstate commerce. We give below a summary of the 1926 legislation relating to workmen's compensation. The summary follows the abstract of this legislation printed in the *American Labor Legislation Review*.

**KENTUCKY.** In an amendment to the workmen's compensation laws, the State empowered the board to appoint as assistant an actuary at \$3500, instead of a medical director at \$3000, and to order fee to be paid direct to claimants' attorneys, commuting to a lump sum for that purpose part of the final payments of the award. The definition of employer was extended to cover all departments of the State government. The periods of suspension of employment during which employees' acceptance remains effective was limited to less than one year, and the procedure in cases appealed to courts was changed.

**LOUISIANA.** Under the amendment to existing laws, the term employee and independent contractor were specifically defined, and the responsibility of the sub-contractor for payment of compensation was made more definite. The number of weeks for which compensation is due for loss of an arm was raised from 175 to 200, while the number for the loss of a leg was reduced from 200 to 175. Compensation for permanent partial loss of use of any member was declared

to be in proportion to the loss of use of such member. Certain cases of hernia were declared compensable as temporary disability and entitled to specific medical attention. The provisions regarding division of death benefits among dependents and termination of payments were revised.

Permission of court to lengthen interval between compensation payments to one month by agreement is no longer required, and in cases of temporary disability the court may award compensation for a number of weeks based upon the probable duration of disability. Commutation of payment to a lump sum is permitted when approved by the court, but such settlement without approval of the court or at a discount of more than 8 per cent per annum makes employer liable for payment of one and one-half times instead of twice the original award if demanded within two instead of five years after payment of lump sum. Regulations concerning procedure in settlement of disputed cases by court were revised and expanded; proceedings, for compensation or concerning an award, which in the judgment of the court have not been brought on reasonable grounds shall be defrayed entirely by the party bringing the action. Maximum fees for attorneys were prescribed, and soliciting of business is declared a misdemeanor. Insurance regulations were also modified.

**MASSACHUSETTS.** An amendment to existing laws added to the list of persons to be conclusively presumed to be wholly dependent upon a deceased employee, a parent, an unmarried child under the age of eighteen years, provided that such child was living with the parent at the time of the injury resulting in death. A commission of five citizens was appointed by the governor, with the advice and consent of the council, to investigate the present workmen's compensation law and to recommend changes.

**MISSOURI.** The workmen's compensation act, which was passed by the legislature of 1925, was ratified by popular referendum at the 1926 election, and was promulgated by the governor on November 16, to go into full effect on Jan. 9, 1927.

**NEW JERSEY.** By amendment to existing laws, radium necrosis was added to the list of compensable occupational diseases.

**NEW YORK.** Under the new amendments to the workmen's compensation laws, officials were forbidden to require a fee for issuing transcript of judgment in cases of default in compensation payment; the department of labor was empowered to subpoena books, papers, etc., along with persons; individual employers and executive officers of corporations were no longer required to perform labor incidental to their occupations in order to elect compensation insurance for themselves; an employer or a carrier was required to give notice to the industrial commissioner whenever for any reason compensation payments cease, instead of when final payment is made or due; notice of death for which compensation is payable was to be given within thirty days after accident, but knowledge of death on part of the employer or his agents was made grounds for excusing failure to give notice; the president, the secretary and the treasurer of a corporation were made liable for failure of a corporation to insure its employees; requirements as to workmen's compensation insurance rates were revised, as were also the regulations as to investment of the State fund's surplus and reserve; expenses

of examination of affairs of the State fund are now chargeable to the fund. The State Labor Department is to be reorganized according to the ratification of the amendment of the State constitution in November, 1925, the successor to the then commissioner having a term of office coincident with the term of the governor making the appointment and being removable when in the judgment of the governor the public interest shall so require. His salary was increased from \$10,000 to \$12,000.

**RHODE ISLAND.** An amendment to the workmen's compensation laws prescribes in detail the schedule of charges for which the employer shall be responsible. In the case of an agreement between the employer and the employee, approved by the commissioner and involving future payments of compensation aggregating not more than \$50, the attorney general shall, at the written request of the commissioner, prosecute action to compel either party to the agreement to comply with its terms. A commission of seven qualified electors, including two members of the house and two of the senate, was appointed by the governor to investigate the proper method of the administration of the workmen's compensation law.

**VIRGINIA.** Under an amendment to the existing laws, the definition of employee was extended to include members of the national guard; their average weekly wage was deemed, for the purposes of the act, to be \$30. An unpaid commission of five qualified voters was authorized to investigate insurance rates, including those for workmen's compensation, in Virginia and other States, to ascertain whether unjust discrimination is made by insurance companies against employers in Virginia.

**WASHINGTON.** By the amendments passed in 1925 the provisions of the workmen's compensation law are now to apply to all maritime workers not covered, in the case of personal injury or death, by the United States maritime laws, instead of only to those whose payrolls for work on shore and off shore are clearly separable. When the employer is unable to make an accurate segregation of such payrolls, the director of the department of labor and industries is authorized to make such segregation and, on this basis, the employer is to pay into the accident fund to cover the shore part of such employees' work. Independent contractors engaged through or by their employees to perform extra-hazardous work for a common carrier by railroad are specifically included under the provisions of the workmen's compensation law.

**UNITED STATES.** Under laws passed by the 69th Congress, 1st session, the provision for medical and surgical aid is liberalized so as to include all services, appliances and supplies which in the opinion of the commission are likely to give relief or reduce degree or period of disability and all expenses therewith. Provision regarding expenses is to apply to previous awards of the commission.

**FRANCE.** A number of amendments to the French workmen's compensation laws were passed during the year, reports the *Monthly Labor Review*. Laws dated July 9 and June 30 amend the industrial compensation legislation, which dates back originally to 1898, by increasing the basic figure upon which compensation is calculated. It should be borne in mind that compensation is not based upon the actual monetary

wage, but is calculated as a percentage of a minimum scale plus proportionately smaller allowances for wages that are in excess of the minimum. Inasmuch as franc wages have increased with the depreciation of the French currency, the minimum wage figure had become antiquated. In addition to these amendments, a law passed April 30 amends the agricultural compensation act of 1922 by removing the exemption for farmers working alone or with their families and occasionally assisted by hired men. Hereafter such farmers are liable for accidents to either paid or unpaid workers.

#### WORKMEN'S COMPENSATION INSURANCE. See INSURANCE.

**WORLD COURT.** The Permanent Court of International Justice, with headquarters at The Hague (see YEAR BOOK for 1922, 1923, 1924, and 1925), had, from the time of its institution in 1922 to the end of the year 1926, rendered seven judgments and handed down 13 advisory opinions. Five of these judgments and twelve of the advisory opinions were discussed in the issues of the YEAR BOOK for 1925. The sixth and the seventh judgments were concerned with the conflict between German and Polish interests in Upper Silesia. The sixth judgment was rendered on objections taken by Poland, and the seventh on the merits of the case. The sixth was rendered Aug. 25, 1925; the seventh May 25, 1926. "The decision of the World Court, awarding to its German owners the Chorzow nitrogen works in Upper Silesia, is very gratifying to Germany, as they believe that the precedent created will enable them to recover from Poland a large amount of property lost through the alienation of that property," said *Current History* (New York).

The twelfth advisory opinion, handed down July 23, 1926, was concerned with the interpretation of Article 3, Paragraph 2, of the Treaty of Lausanne, governing the frontier between Turkey and Irak. The parties to the dispute were Great Britain and Turkey. (For details, see MESOPOTAMIA.)

The thirteenth advisory opinion was handed down July 23, 1926, in the matter of the competence of international labor organizations to regulate, incidentally, the personal work of the employer. The interested parties in the matter were international labor organizations, the international organization of industrial employers, the International Federation of Trade Unions, and the International Federation of Christian Trades Unions.

Announcement was made, during the year, that 31 of the 75 articles of constitution of the Court which went into effect Mar. 24, 1922, had been revised. The bulk of the changes are concerned with the methods of procedure of the Court. Several related to the rendering of advisory opinions, and had a bearing on the fifth reservation made by the United States on its proposed adherence to the Court. (See below.) Under the new rules, the Court will sit in private to deliberate upon advisory opinions. The rules provide also for a method of procedure to be followed by any state desiring to intervene in the rendering of an advisory opinion. Under the new rules, judges dissenting from an advisory opinion of the Court may attach to the opinion of the Court either an expression of their individual opinions or a statement of their dissent.

**THE UNITED STATES AND THE WORLD COURT.** On Jan. 27, 1926, the United States Senate, by a

vote of 76 to 17, passed a resolution agreeing to the adherence of the United States to the Permanent Court of International Justice (the "World Court"), with five reservations. (A summary of the reservations will be found in the article, UNITED STATES, *Sixty-ninth Congress, Action on the World Court Protocol*.) Secretary of State Kellogg promptly communicated this action to the states that had signed the Court protocol, asking them individually to inform him whether or not they accepted these reservations as a "part and condition" of American adherence.

Secretary Kellogg, on March 2, wrote to the Secretary General of the League of Nations, referring to the State Department's receipt, in 1921, of the protocol of the Court, and informing him of the Senate resolution of 1926 and of the communication then being sent to every member nation of the Court. Mr. Kellogg said in part: ". . . The signature of the United States will not be affixed to the said protocol until the governments of the powers signatory thereto shall have signified in writing to the government of the United States their acceptance of the foregoing conditions, reservations and understandings as a part and condition to the adherence of the United States to the said protocol and statute."

When Mr. Kellogg's letter to the Secretary General was brought up, on March 18, at a meeting of the Council of the League of Nations, Sir Austen Chamberlain pointed out that the special conditions on which the United States desired to adhere to the Court could not appropriately be embodied in a series of separate exchanges of notes, but would need to be embodied in a special agreement or protocol between the present member nations of the Court on the one hand and the United States on the other. He further said: "The terms of the fifth reservation necessitate further examination before they could safely be accepted by the states which are parties to the Court protocol. This paragraph is capable of bearing an interpretation which would hamper the work of the Council and prejudice the rights of members of the League, but it is not clear that it was intended to bear any such meaning."

On Sir Austen's recommendation, the Council decided to call a conference of representatives of the member nations of the Court and of the government of the United States, to be held in Geneva on September 1, to facilitate common action on the American reservations by all the member nations of the Court and to frame any new agreement that might be found necessary to give effect to the special conditions on which the United States was willing to adhere to the Court.

The Government of the United States on March 29 received from the Secretary General of the League an invitation to participate in such a conference. The letter of invitation made it clear that it was to be a conference of the signatory states of the Court protocol and the United States. This invitation was declined by the United States. Secretary Kellogg's reply emphasized that the United States expected the reservations to be acted upon and replied to by the signatory nations acting individually and directly. His letter was, in part, as follows:

I do not feel that any useful purpose could be served by the designation of a delegate by my government to attend a conference for this purpose. These reservations are plain and unequivocal, and according to their terms they must be accepted by an exchange of notes between the United States and each of the forty-eight states sig-

natory to the statute of the Permanent Court before the United States can become a party and sign the protocol. The resolution specifically provided this mode of procedure.

I have no authority to vary this mode of procedure or to modify the conditions and reservations or to interpret them, and I see no difficulty in the way of securing the assent of each signatory by direct exchange of notes, as provided for by the Senate. It would seem to me to be a matter of regret if the Council of the League should do anything to create the impression that there are substantial difficulties in the way of such direct communication. This government does not consider that any new agreement is necessary to give effect to the conditions and reservations on which the United States is prepared to adhere to the Permanent Court. The acceptance of the reservations by all the nations signatory to the statute of the Permanent Court constitutes such an agreement. If any machinery is necessary to give the United States an opportunity to participate through representatives for the election of judges, this should naturally be considered after the reservations have been adopted and the United States has become a party to the statute of the Permanent Court of International Justice. If the states signatory to the statute of the Permanent Court desire to confer among themselves, the United States would have no objection whatever to such a procedure, but under the circumstances, it does not seem appropriate that the United States should send a delegate to such a conference.

Meanwhile, however, in advance of the conference, certain states, in reply to Secretary Kellogg's letter, accepted the American reservations; Cuba (March 17); Greece (April 9); Liberia (May 11); Albania (August 11); Luxembourg (August 21); and Santo Domingo, August 30, wrote that its representative at Geneva had been instructed to "vote for" the American reservations but that ratification by the legislature would be necessary.

The Geneva conference met on September 1, with 40 signatory states represented. It considered that an exchange of notes was not an adequate method of altering an international treaty like the statute of the Court. It proposed, as a necessary means of putting the American reservations into effect, a special agreement between the United States on the one hand and the other nations now in the Court on the other hand. It therefore drew up and accepted a preliminary draft protocol, embodying the conclusions reached on the American reservations, which, if ratified by all parties concerned, would have the same force and effect as the court statute. The conference had well in mind that the procedure prescribed by the Senate resolution necessitated an individual reply from each government. It maintained that an international treaty could not be amended by a series of individual notes.

Practically every speaker in the conference expressed the desire of his country to have the United States in the Court.

The first three reservations and part of the fourth were accepted unconditionally, but two provisions—the second part of the fourth reservation, and the fifth—the conference accepted conditionally; i. e. with the right to withdraw its acceptance of them if it should be found that the situation created by them was not workable—as the report puts it, "if it were found that the arrangement agreed upon was not yielding satisfactory results."

The conference hesitated on the second part of the fourth reservation (providing that the statute of the Court shall not be amended without the consent of the United States) because the conference was not clear as to exactly how the statute of the Court could be amended, and consequently not clear as to whether this reserva-

tion asked a special privilege for the United States or not. The Court statute had never yet been amended, and the point as to how it might be amended had not come up. There was no provision covering this in the statute.

So far as the first part of the fifth reservation was concerned, requiring that advisory opinions shall be rendered publicly after hearings, etc., the conference pointed out that the rules of the Court provide for full publicity in the procedure for reaching and rendering advisory opinions. The rules of the Court can be rather readily changed, and there is nothing in the less easily changed statute governing publicity for advisory opinions (and nothing about advisory opinions at all). Therefore, the conference further suggested—including in the suggested special agreement between the signatory nations and the United States the following article—that "the Court shall render advisory opinions in public sessions."

The real trouble-maker among the reservations was the second part of the fifth, asking for the United States the right to veto any request for an advisory opinion touching any question in which the United States "has or claims" an interest. Almost without exception, those present at the conference declared it was impossible to tell exactly what the United States was asking by this reservation. They found the wording inexact, puzzling, of indefinable implication. It was entirely clear that the conference did not object to the United States' making some reservations in the matter of advisory opinions. It was declared that no objection whatever would have been raised, for instance, to the reservation first approved by President Coolidge providing that "the United States shall not be bound by advisory opinions which may be rendered by the court upon questions which the United States has not voluntarily submitted for its judgment." But such a reservation, the conference pointed out, is very different from the present second part of the fifth which demands for the United States the right to prevent the giving of an advisory opinion in any case in which the United States "has or claims an interest."

The conference readily agreed that if the United States were a party to a dispute, it should have a right to veto the rendering of an advisory opinion upon that dispute. It further pointed out that the Court, not explicitly in any document, but implicitly in its operation to date, has recognized the right of either of the nations party to a dispute to prevent the giving of an advisory opinion. For instance, in the Eastern Karelia case, Russia, one of the parties, refused to appear, refused to furnish the Court with information, etc. and the Court therefore refused to give an advisory opinion in the case.

The Council and the Assembly are the only two agents with authority to request an advisory opinion from the Court. To the end of 1926, only the Council had actually made such requests. The votes thus far in the Council on this matter have been unanimous, but the requirement of a unanimous vote has never been established.

The conference was at a loss what to say to the United States. If a unanimous vote was required for requests for advisory opinions, then this reservation asked for the United States only a privilege already held by the members of the Council of the League. If only a majority is re-

quired, then this reservation would give the United States a special power of veto.

The conference formulated also the following as the 3rd paragraph of Article 4 in the suggested protocol to be made between the United States and the signatories: "Should the United States offer objection to an advisory opinion being given by the Court, at the request of the Council or the Assembly, concerning a dispute to which the United States is not a party, or concerning a question other than a dispute between states, the Court will attribute to such objection the same force and effect as attaches to a vote against asking for an opinion given by a member of the League of Nations either in the Assembly or the Council."

A further source of grave difficulty was seen by the conference in the lack of certain knowledge as to just what the procedure would be for applying the second part of the fifth reservation. What, they asked, were the relative powers of the President of the United States and the Senate in such a matter? The conference did not know whether, under the Constitution of the United States, it would be the duty of the Executive or Senate to state whether the United States had or claimed an interest in a dispute, and agreed to or objected to the giving of an advisory opinion, or whether such action could be taken by the executive only by and with the advice and consent of the Senate; if the latter, and if Congress were not in session, what could be done? Under the wording of the reservation, the Court cannot even "entertain a request" for an advisory opinion in such a case; and since the real use of the advisory function is to give an opinion on a specific point of law in an actually existing controversy, the delay in waiting for an expression of opinion from the United States might make it impossible to obtain the opinion in time to prevent the controversy from becoming acute.

Conditional acceptance of the fifth United States reservation would mean that if the Court may not entertain a request for an advisory opinion, after the Council or the Assembly has asked it to do so, without American consent, on any question in which the United States has, or claims, an interest, and if it takes so long to ascertain whether the country has or claims an interest, then the use of the Court in this way to bring about the peaceful settlement of international disputes is hampered, and the other nations will have to withdraw their acceptance of this reservation. They felt it necessary to make their acceptance of this reservation conditional, in order to safeguard this advisory function, which they regard as very useful.

It was repeatedly made clear that the conference wished on every point to assure the United States an equal vote, but on no point a determining power of veto not possessed by the other signatories.

On November 11, President Coolidge in his Armistice Day speech at Kansas City said of the situation:

I have advocated adherence to such a court by this nation on condition that the statute or treaty creating it be amended to meet our views. The Senate has adopted a resolution for that purpose. While the nations involved cannot yet be said to have made a final determination, and from most of them no answer has been received, many of them have indicated that they are unwilling to concur in the conditions adopted by the resolution of the Senate. While no final decision can be made by our government until final answers are received, the situation has been sufficiently developed so that I feel warranted in saying that I do not intend to ask the

Senate to modify its position. I do not believe the Senate would take favorable action on any such proposal, and unless the requirements of the Senate resolution are met by the other interested nations I can see no prospect of this country adhering to the court.

See LEAGUE OF NATIONS.

**WORLD CROPS.** See AGRICULTURE.

**WORLD FEDERATION OF EDUCATION ASSOCIATIONS.** See EDUCATION.

**WRANGELL LAND.** The expulsion of Alaskan Eskimo from this island was followed by its permanent occupation by Russia. Under its policy of exercising its control over all possible regions, the Soviet Government organized and carried out a plan of colonizing Wrangell Land. An elaborately equipped expedition surveyed the island, and established a colony drawn from the nomadic tribes of Siberia. For the 50 settlers there were built storehouses, etc., with headquarters for the Soviet officials. After their habit, the natives were to live in tents. The area of the island approximates 3000 acres. Although the vegetation is scant, there are found numerous arctic animals.

**WRECKS.** See SAFETY AT SEA.

**WRESTLING.** Professional wrestling attracted little interest during 1926, but in amateur and college circles the sport had a greater appeal. The most important professional match of the year was that between Joseph Stecher, claimant of the world's heavyweight title, and Ivan Poddubny of Russia. Stecher won in 1 hour, 3 minutes, 47 seconds.

The annual tournament of the Amateur Athletic Union was held at Corvallis, Ore., the winners of the final bouts being as follows: 112 pounds, L. Lupton; 118 pounds, C. Mitchell; 126 pounds, H. Boyvey; 135 pounds, A. Morrison; 147 pounds, R. Myers; 160 pounds, R. Hammond; 175 pounds, F. Bryan; heavyweight, C. Strack.

Cornell University won the United States intercollegiate championship with a score of 22 points, Lehigh University finishing second with 15 and Penn State College third with 14. The individual winners were: 115 pounds, Reed, Lehigh; 125 pounds, Best, Lehigh; 135 pounds, Chakin, Cornell; 145 pounds, Buttery, Princeton; 158 pounds, Miller, Yale; 175 pounds, Russell, Yale; heavyweight, Affeld, Cornell.

**WÜRTTEMBERG**, würt'tēm-bêrk. A constituent state of the German republic since November, 1918; formerly a kingdom of the German Empire. Area, 7534 square miles; population, according to the census of 1925, 2,595,114. Chief city, Stuttgart, with a population in 1925 of 337,199. The movement of population in 1923 was: Births, 52,356; deaths, 37,623; marriages, 20,751. The chief occupation is agriculture, about 64 per cent of the total area being under cultivation. The chief crops with their acreage and production in 1924 were: Wheat, 202,120 acres, 87,412 tons; rye, 68,895 acres, 26,731 tons; barley, 242,092 acres, 95,998 tons; oats, 258,624 acres, 102,469 tons; potatoes, 199,232 acres, 618,328 tons; hay, 1,289,985 acres, 2,556,246 tons; vines, 26,247 acres, 1,443,112 gallons of wine. The estimated revenue for the year ending Mar. 31, 1925, was 209,818,702 marks; expenditure, 219,582,627 marks. Supreme power is vested in the landtag, composed of 80 members elected for four years by universal suffrage. This body appoints the state ministry, whose president is styled state president. State president and minister of education in 1926, Wilhelm Bazille.

**WYOMING. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 194,402. Estimates made as of July 1, 1926, indicated a population of 236,000. The largest city was Casper, which increased from 11,447 in 1920 to 23,288 in 1925. The capital is Cheyenne.

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay, tame	1926	682,000	1,326,000 *	\$11,271,000
	1925	668,000	1,288,000 *	11,419,000
Corn	1926	197,000	8,940,000	2,887,000
	1925	191,000	4,393,000	3,075,000
Wheat, winter	1926	42,000	756,000	809,000
	1925	35,000	560,000	694,000
Wheat, spring	1926	138,000	2,622,000	2,806,000
	1925	120,000	2,160,000	2,678,000
Oats	1926	134,000	4,690,000	2,110,000
	1925	134,000	4,690,000	2,157,000
Potatoes	1926	18,000	1,456,000	1,820,000
	1925	12,000	1,440,000	2,804,000

\* tons.

**MINERAL PRODUCTION.** Petroleum, from which is derived the greater part of the total annual value of the State's mineral production, yielded a decreased quantity in 1925, but attained a higher value for the year's product. Production of petroleum was 29,217,000 barrels, as against 39,498,000 in 1924; valued for 1925 at \$49,600,000 (estimated) and for 1924 at \$48,600,000. Of coal the State produced 6,887,000 short tons in 1925, and 6,757,468 in 1924. Coal produced in 1924 was valued at \$18,327,000; in 1923, at \$20,916,000. Natural gas production attained 46,036,000 M cubic feet in 1924 and 35,523,000 M cubic feet in 1923; in value, \$4,081,000 in 1924 and \$4,222,000 in 1923. From natural gas were made 32,700,000 gallons of gasoline in 1925 as against 29,272,000 in 1924; valued at \$3,115,000 (estimated) for 1925 and \$2,979,000 for 1924. The minor products included stone, sand and gravel, gypsum, and clay products. The total value of the State's mineral product in 1924 was \$75,494,166; in 1923, \$77,664,547.

**FINANCE.** As summarized by the United States Department of Commerce, payments for maintenance and operation of the general departments of the State in the fiscal year ending Sept. 30, 1925, were \$5,011,396. Their rate per capita was \$22.72, as against \$16.47 in 1924 and \$11.59 in 1917. Their total included \$2,060,835 for education, apportioned among minor State divisions. Payments amounting to \$79,308 for interest on debt and \$3,000,858 for permanent improvements, added to the payments for maintenance and operation of State departments, made the year's total of State payments \$8,191,662. For highways there was expended by the state the sum of \$3,402,028, of which \$852,177 was for the maintenance and \$2,549,851 for the construction.

Revenue receipts of the State were \$8,559,101, or \$38.80 per capita. They exceeded by \$3,368,397 the total payments except those for permanent improvements, and, furthermore, exceeded by \$367,539 the total with these included. Revenue not otherwise used was employed for the reduction of bonded debt or carried in cash balances. Property and special taxes formed 17 per cent of the revenue in 1925, as against 25.5 in 1924 and 48.4 in 1917. Their per capita rate was \$6.60 in 1925, as against \$8.38 in 1924

and \$5.51 in 1917. Earnings of the departments and compensation for officials' services furnished 3.5 per cent of the 1925 revenue; business and non-business licenses, 12.5 per cent. License receipts included those from taxes on incorporated companies, on sales of gasoline and on motor vehicles.

The net indebtedness of the State on Sept. 30, 1925, was \$2,403,160, or \$10.89 per capita, as against \$13.46 in 1924 and 56 cents in 1917. The assessed valuation of property subject to State tax was \$460,539,192. The State tax levy was \$1,650,559, or \$7.51 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 1992. There was constructed in 1926 new first track to the length of 13 miles.

**EDUCATION.** A plan of rural school reorganization reported by Katharine A. Morton, State superintendent of public instruction, provided important changes in the methods of instruction. It lengthened the class periods, while at the same time reducing the long study periods. While increasing the size of classes, it sought to individualize instruction. Fourteen class periods daily were provided for the school of the eight-grade, one-room type. There was continued growth of the University of Wyoming, and particularly of the university's summer school at Laramie, situated at an altitude of 7000 feet. For the school year 1925-1926, the school population was given as 63,074. There were enrolled in the public schools 50,138 pupils, of whom 9664 were enrolled in high schools. The year's total of expenditures for public school education was \$8,397,353.

**CHARITIES AND CORRECTIONS.** The girls' industrial institute, established by law of 1925 for the custody and discipline of incorrigible girls, was opened at Sheridan, Sept. 15, 1925, with 10 girl inmates, and had 27 on Sept. 30, 1926. Other institutions under the control of the State board of charities and reform, at the end of 1926, were: Wyoming State Hospital, Evanston, (insane) 394 inmates; Wyoming State penitentiary, Rawlins, 256 inmates; Wyoming soldiers' and sailors' home, Buffalo, 30 inmates; Wyoming general hospital, Rock Springs, 1187 patients treated in the year ending September 30; Wyoming state training school, Lander, 187; Wyoming industrial institute, Worland, 148 delinquent boys; Home for Dependent Children, Cheyenne, 41 children. Construction was begun in the year on the first building of the projected Wyoming tuberculosis sanatorium, at Basin.

**POLITICAL AND OTHER EVENTS.** At the election, November 2, Frank E. Emerson, Republican candidate, was elected Governor for the four-year term beginning January, 1927. He defeated Governor Nellie Tayloe Ross, Democrat, running for reelection. C. E. Winter, the State's member (Republican) of the House of Representatives was reelected. Other State officers elected in November were Secretary of State, A. M. Clark; Treasurer, W. H. Edelman. Auditor Vincent Carter and Superintendent of Public Instruction Katharine A. Morton were reelected. The appointment of W. O. Wilson as Attorney-General for the ensuing term was announced.

The Wyoming wool growers' association passed resolution December 10, favoring legislative action against wild horses and declaring these a detriment to the sheep ranges. The wild horses in the State were declared to have become more

abundant because of the decline in the market price for range horses. Ranchmen had largely ceased to ship them, and had likewise given up branding the herds. The uncertain status of the horses in the eye of the law protecting animal property deterred ranchers and hands from shooting wandering animals.

**OFFICERS.** Governor, Mrs. Nellie T. Ross; Secretary of State, F. E. Lucas; Treasurer, John Snyder; Auditor, Vincent Carter; Superintendent of Public Instruction, Katharine A. Morton; Attorney-General, D. E. Howell.

**JUDICIARY.** Supreme Court: Chief Justice, C. N. Potter; Associate Justices, Fred H. Blume and Ralph Kimball.

**WYOMING, UNIVERSITY OF.** A State institution of higher education at Laramie; founded in 1886. It consists of a college of liberal arts, a college of agriculture, a college of engineering, a college of education, and a law school. The enrollment for the autumn of 1926 was 1023. The registration for the two summer school sessions of six weeks each and the supplementary six weeks' session at Sheridan totaled 1383. The teaching faculty numbered 95. The productive funds of the university for the year 1925-26 amounted to \$1,796,486, and the income for the same period was \$1,150,835. The library contained 62,281 volumes. A new engineering building, erected at a cost of \$160,000, was reaching completion in 1926. President, Arthur Griswold Crane, Ph.D.

**X-RAYS.** See GALL STONE DISEASE; PHYSICS.

**YACHTING.** The only international yacht competition of importance during 1926 was the international six-meter races held at Oslo, Norway, for the Norwegian Gold Cup. Fifteen yachts, representing five nations, took part, the winner being *Lanai*, owned and sailed by H. F. Whiton of Oyster Bay, N. Y.

A feature of the season in the United States was the return to competition of *Resolute* and *Vanitie*, former defenders of the America's Cup and modernized into Marconi schooners. *Vanitie*, owned by H. P. Whitney and handled by Charles Francis Adams, made an excellent showing, capping its string of victories by winning the race for the King's Cup during the New York Yacht Club's cruise. The other trophies in this annual yachting fixture were distributed as follows: Astor Cup, schooners, *Pleione*, owned by J. V. Santry; Astor Cup, sloops, *Carolina*, Commodore George Nichols; Commodore's Cup, schooners, *Resolute*, E. Walter Clark; Commodore's Cup, sloops, *Shawara*, Hoyt and Hoffman.

The winners of the leading Long Island Sound championships were as follows: New York Yacht Club 40-foot class, *Typhoon*, owned by C. Smithers; 30-foot class, *Narcissus*, F. S. Page; twenty-rater, *Bob-Kat*, Robert B. Meyer; Sound schooner, *Rival*, S. A. Lynch, Jr.; six-meter, *Hawk*, A. E. Luders, Jr.; Victory, *Black Jack*, T. S. Clark; Sound interclub, *Wee Betty*, G. La Branche; star class, *Irew*, E. A. Ratsey; handicap, first division, *Young Miss*, L. Schwarcz; handicap, second division, *Acadian*, F. E. Raymond. The New London-to-Bermuda yacht race, 660 miles, was won by *Malabar VII*, owned by John G. Alden, in 116 hours, 4 minutes, 37 seconds.

Motor boating in 1926 proved especially popular, and more race events were held than ever before. *Greenwich Folly*, owned by George H. Townsend, captured the Gold Cup, fifteen boats

competing. The winner set a record for the best elapsed time, for the 90 miles, of three heats, 1 hour, 51 minutes, 40 seconds. Richard F. Hoyt's *Imp*, however, made the fastest time for a lap, averaging 53.58 statute miles an hour for the three-mile circuit. The Dodge Trophy went to *Roudy*, owned by Carl Fisher. *Miss America V.* won the Harmsworth Trophy.

**YALE UNIVERSITY.** A non-sectarian institution of higher education at New Haven, Conn.; founded in 1701. The university consists of ten schools, as follows: Undergraduate: Yale College (1701), Sheffield Scientific School (1847); graduate and professional: graduate school (1846), school of medicine (1810), divinity school (1882) school of law (1824), school of the fine arts (1866), school of music (1894), school of forestry (1900), school of nursing (1923). Since 1920 the undergraduate freshman year has been under the jurisdiction of a separate dean and faculty. The enrollment for the autumn of 1926 was 5583, including 623 who were not candidates for degrees. Of those working for degrees 600 were in the graduate school; 1548 in Yale College; 712 in the Sheffield Scientific School; 876 in the freshman year; 207 in the school of medicine; 217 in the divinity school; 418 in the school of law; 295 in the school of the fine arts; 96 in the school of music; 38 in the school of forestry; and 39 in the school of nursing. The registration for the summer session of the school of law was 146. The faculty numbered 1039, consisting of 194 of professorial rank, 52 associate professors, 238 assistant professors, 219 instructors, and 436 assistants. The library, including the departmental libraries, contained 1,775,077 volumes and pamphlets. The total endowment was \$45,603,713 and the income for the year \$5,244,051.

A gift from Edward S. Harkness (B. A., Yale, 1897), in 1924, provided for the building of a university theatre and the establishment of a department of the drama in the school of fine arts. Prof. George Pierce Baker was appointed to the chair of the history and technique of the drama, and made director of the theatre. The enrollment in this department in 1925 was limited to 75 students. The theatre, which was formally opened Dec. 10, 1926, with a series of performances of a play by one of the students, is Gothic in design, and has three distinct features—a complete theatre, a school of the drama, and accommodations for the Yale Dramatic Association. In addition to a theatre in the usual sense, there are lecture rooms, workshops where scenery and costumes can be made, and lighting equipment prepared and kept; rehearsal rooms, so that more than one play, or different acts of the same play, may be in rehearsal at the same time; and a green room for a social centre for the actors and the working force of the theatre.

In 1926 the law school raised its entrance requirements so that men from another law school could not be admitted unless they had an average of "B" in their work in that school, and college graduates who had not previously studied law could not enter unless they maybe expected to attain an average of "C" in their work. The law school also introduced a system of honors courses under which men of high standing are permitted to do individual research work, or to carry on intensive study in small groups in the final year of their course.

Through the gift of \$1,000,000 from two anony-

mous donors, construction of an art museum was begun. The trustees of the estate of the late John W. Sterling provided funds for the erection of the Sterling Memorial Library, to contain eventually 5,000,000 volumes, with accommodations for special collections and seminars. Through a gift from the late William L. Harkness and members of his family, a new recitation hall, the William L. Harkness Educational Building, was under construction. This building was planned to contain 33 offices for members of the faculty, as well as class rooms. On the site of Osborn Hall the University was erecting Charles W. Bingham Hall, built through a gift of \$1,000,000 from the sons and daughters of Charles W. Bingham, '68, of Cleveland, Ohio, to provide dormitory accommodations for 116 students. Funds for the Yale memorial to those who lost their lives in the World War were provided by the graduates through the efforts of a committee of the alumni advisory board, and it was planned to build this memorial in the form of a colonnade, with an altar of liberty in the centre. President, James Rowland Angell, Ph.D., Litt.D., LL.D.

**YAP.** A Japanese island of the Caroline group in the Pacific, centre of administration for the western Carolines; an important wireless and cable station. Population, 8339.

**YELLOW FEVER.** This disease in 1926 was quiescent in the entire North American continent, but the old fastnesses of infection in Mexico are but a few days' travel from the United States border, and the *Edes Aegypti* mosquito, the vector of the living cause of the disease, abounds along the Rio Grande. For four years, the United States had been carrying out measures for the extermination of the mosquito, and had met with much success through the co-operation of the local and State health authorities. Three mosquito-borne diseases occurred in this area in the past—yellow fever, malaria and dengue. (See an article by Dr. Tappan in the *Journal of the American Medical Association* for September 25.)

The late Dr. Juan Guiteras (q.v.) bequeathed to Prof. W. H. Hoffmann of the University of Havana all of the documents accumulated by him in his quarter-century study of yellow fever, with histories of 107 personal cases treated and a summary of his views on the disease. It is a form of hæmolytic sepsis caused by the *Leptospira icteroides*, the toxin of which causes acute degenerative changes in the heart, liver, kidneys, blood vessels, etc., and often leads rapidly to death. Degeneration of the blood vessels is responsible in part for the severe hemorrhages including the so-called "black vomit," and the jaundice is the consequence of the hæmolysis and absorption of the liberated blood-coloring matter. The presence of the toxin in the blood causes the formation of anti-bodies which, as in the case of children, are often able to neutralize it and make recovery possible. Diagnosis of mild cases is often so difficult that it can be made only through the demonstration of the *leptospira*. The only direct treatment is the Noguchi serum. (*Deutsche Medizinische Wochenschrift*, October 8.)

Dr. Henry Hanson gives a personal experience with the disease in the *Journal of the American Medical Association* for February 20. It occurred in Peru in 1919, when he was a member of the Peruvian health department. He was probably accidentally infected in the course of making a

blood test, the incubation period being 4 or 5 days. He resumed work on the 12th day, but at once relapsed, not from the disease itself but from the weakened state of the heart muscle. On this account he insists on prolonged convalescence in bed for all patients, with absolute rest and fasting during the febrile period, allowing only vichy, as much as desired. This management will avert the supervision of vomiting. Visitors are never admitted.

**YEMEN, IMAMATE OF.** See ARABIA.

**YI, (SYEK), PRINCE.** Former Emperor of Korea, died in his palace at Seoul (Keijo), Korea, April 25. He was born in the palace of Seoul in 1874, and succeeded to the throne on the abdication of his father, Yi Hyeung, in July, 1907. He was the thirty-fifth and last sovereign of his dynasty, although he was a ruler in name only. The Japanese influence had been gradually growing stronger, and although he was credited with considerable ability, he was never able to use it. He was generally known as Yi Wang (Wang meaning "King" or "ruler"), but he lost his throne in 1910 when the Japanese Government declared the annexation of Korea as a consequence of the assassination of Viscount Ito, the first viceroy, by a Korean fanatic. The Japanese referred to the head of the old royal house by the title "Prince Yi." Korea had actually been under Japanese protection since the Russo-Japanese War (1905), as indicated by a clause in the Treaty of Portsmouth. His son, Prince Yi Pang, entered the Japanese army as a commissioned officer, and married the Japanese Princess Masako, daughter of Prince Nashimoto, taking up his residence in Tokyo.

**YORKTOWN, BATTLE OF.** See CELEBRATIONS.

**YOSHIHITO, HARUNOMIYA.** The 123rd Emperor of Japan, died at the Imperial Palace at Hayama, Japan, December 25. He was the son of the Emperor Mutsuhito (known to history as the Emperor Meiji), and the Princess Yanagawara, and was born Aug. 31, 1879. The Emperor Meiji's first wife was childless, and, for the sake of succession, the Emperor availed himself of the Japanese law which permitted him to call to the palace, as concubines, twelve women of royal or noble birth. The Princess Yanagawara was the first of these, and Prince Yoshihito was the third son she bore the Emperor. Nominated heir apparent in 1889, Yoshihito was taken from his mother, and was given a palace apart, with his own retinue of servants and private tutors. At the age of sixteen he became a colonel, and almost always appeared in a military uniform of foreign design. He was the only ruler of Japan in modern times to go beyond the confines of Japan proper, having made one journey to Korea. In 1900 Prince Yoshihito married Princess Sada.

The prince was always physically weak, and although he at first seemed to take his duties and responsibilities as crown prince very seriously and to attack them with vigorous interest, reports seeped through to the common people of his illness. Eventually it became common knowledge that the Emperor was completely incapacitated mentally and physically, and he could no longer receive foreign ministers in person. The first son of Prince Yoshihito and the Princess Sada was Prince Michi-no-Miya, born Apr. 29, 1901. He was proclaimed heir apparent in 1912 (the year his father ascended the throne); crown prince in 1916, and regent of Japan after his

return from his foreign tour in 1921. This tour involved the breaking of an age-old Japanese tradition, but Yoshihito had adopted some foreign ideas from his father, and his own studies of world affairs had shown him the advantages of a first-hand knowledge of other lands. The Emperor's health had come to such a low pass in 1921, that he resigned the Government of the country to his son, who was proclaimed Prince Regent in 1921. From that time until his death the Emperor lived in seclusion, almost continuously at the Hayama Palace. His illness became critical on December 9.

In foreign affairs Yoshihito was of a broad and tolerant mind and maintained a policy of dignified friendliness with all foreign powers. Considering his personal handicaps, his accomplishments were many and he displayed a rare discrimination in his studies and interests. He was, it is said, a good French scholar, and could use German to some extent. His greatest ability lay in his skill in verse-making. The greater part of his reign was, however, a period of enforced inactivity.

**YOUNG, RIDA JOHNSON** (Mrs. James Young). American playwright, died May 8 at Southfield, Conn. She was born at Baltimore, Md. in 1876, and attended Wilson College, Chambersburg, Pa. She was the author of several novels and of many plays. Of the former are *Virginal* and *The Girl Who Came Out of the Night*. Her more important plays include: *Brown of Harvard*; *Glorious Betsy*; *Maytime*; *Naughty Marietta*; *The Lottery Man*; *Her Soldier Boy*; *Captain Kidd, Jr.*; *The Boys of Company B*; and *Little Old New York*.

**YOUNG MEN'S CHRISTIAN ASSOCIATION.** An educational, social, physical and spiritual movement for men and boys found in every civilized nation of the world. This organization had its birth in London in 1844, and spread to the United States in 1851. The records, as of June 1, 1926, showed 1,551,148 members throughout the world, 63 per cent of whom were in North America; 7362 employed officers, 73 per cent, in North America; and \$220,210,910 in Association property, 87 per cent in North America. In 1926 the movement in North America involved 1711 local organizations recognized by the convention, with 93,061 directors and voluntary leaders, 5263 paid officers, and a paid-up membership of 948,520 members, 244,498 of whom were boys 12-18 years of age. Five per cent of this body of workers and members were found in the Canadian associations and the remainder in the associations of the United States. Statistics of June 1, 1926, showed \$189,420,000 of net property and funds paid in. Of this amount \$19,970,000 was in endowment funds. The operating expenditures for 1926 were \$54,160,400, more than \$1,000,000 per week. These expenditures were provided for by the members, plus contributions from friends amounting to \$14,759,500.

In its activities, the Young Men's Christian Association movement involves several hundred distinct features or lines of service. In its physical training and service it enrolled in the year ending Apr. 30, 1926, 473,109 men and boys. In educational features, including lectures, discussions, evening schools, and regular college courses, both day and evening classes, about 300,000 men and boys were served. The number in regular courses of instruction covering from two to four years in length and of college grade was

85,231, a number equal to all of the male students in all of the colleges and universities of the United States having an enrollment of less than 3200 each. Among its activities for the development of the spiritual life are many scores of kinds of group organizations and clubs, in addition to the regular Sunday and devotional services and the regular courses in Bible study. During the year 219,885 students were enrolled in the Bible courses, and there was a total attendance of 6,500,000 at the definitely religious meetings of the association.

A few years after the work began in North America, it expanded its helpfulness to foreign lands, where there were, in 1926, 262 local and national secretaries at work in 32 different countries and supported with a budget of \$2,141,000 by the associations of North America. This amount was included in the annual expenditures mentioned above.

For the professional training of secretaries and paid officers there are three Association colleges in the United States: Springfield, Mass., with 473 students; Chicago, with 266; Nashville, Tenn., with 80. To facilitate the training and efficiency of workers who cannot attend these colleges, there are nine summer schools lasting from two to four weeks each. In 1926 these summer schools had an enrollment of 1335. In addition to hundreds of various kinds of bulletins issued by the State and local organizations, there are the following international periodicals for the North American associations: *Association Men*, monthly; *The Intercollegian*, monthly; *The Student World*, quarterly; *Physical Training*, monthly; *The Association Forum*, quarterly.

By the formation of the national councils of the United States and Canada, Jan. 1, 1925, the international committee became only the holding organization for the two national councils and turned over to them the active supervision and promotion of the local and State activities. It also continued a very close relationship to the conduct of the foreign work which was supported by the Association in both national councils. The headquarters and officers of these three organizations were as follows: The International Committee, 347 Madison Avenue, New York; James M. Speers, chairman; Dr. John R. Mott, general secretary. The National Council of the United States, 347 Madison Avenue, New York; D. W. Teachout, chairman, Dr. John R. Mott, general secretary. The National Council of Canada, 86 East Adelaide St., Toronto, Ont.; R. F. McWilliams, chairman, H. Balantyne, general secretary.

**YOUNG WOMEN'S CHRISTIAN ASSOCIATION.** An organization and movement aiming to advance the physical, social, intellectual and spiritual interests of young women, to promote growth in Christian character and service, and to become a social force for the extension of the Kingdom of God. It holds a biennial convention, the 1926 session having taken place in Milwaukee, Wis. The executive committee of the organization is known as the National Board of the Young Women's Christian Associations, and to it is entrusted the work of the organization during the interim of conventions. This board interests itself in the city, town, and county associations throughout the United States and its territories. Through its foreign division it works with other members of the world's committee of the Young Women's Chris-

tian Associations in carrying on association work for women and girls in the Baltic States, the Near East, the Orient, South America, and the Philippine Islands. In the oriental countries work is undertaken by the association only upon invitation of the mission boards already working in the country. In 1926 work was carried on under this department in 12 countries, with a staff of 107 secretaries.

The Young Women's Christian Associations in the United States in 1925 embraced from 900 to 1000 centres and branches, in 245 cities. There were 39 rural associations, doing work in 105 counties, 144 associations in towns, and 682 student associations in schools and colleges. These local associations had a membership of over 605,000 and real property valued at over \$50,000,000. The gross budget of the local associations for 1925 was estimated at approximately \$24,000,000, about 75 per cent of which was met by earnings from cafeterias, boarding homes, etc. The national board budget for the year 1926 was \$2,185,675, of which \$384,777 was for promoting work in China, Japan, India, South America, Mexico, Philippines, Russia, the Near East, and the Baltic States. It also has endowments yielding approximately \$130,000 annually, and income producing and business features which in 1925 represented a gross income of about \$960,000. Contributions in 1925 totaled \$1,184,493. The officers of the national board for 1926 were: Mrs. Robert E. Speer, president; Mrs. John French, chairman of the executive committee; Mrs. John H. Finley and Mrs. John D. Rockefeller, Jr., vice-presidents; Miss Katherine Lambert, secretary; Mrs. Samuel Murtland, treasurer; Mrs. George W. Davison, assistant treasurer; Miss Mabel Cratty, general secretary. The national board operates through three regional offices and its headquarters at 600 Lexington Avenue, New York City. The regional offices are at Chicago, Denver, and San Francisco. The Young Women's Christian Association national school for professional study is at 135 East 52d St., New York.

**YUKON**, yŏŏ'kŏn. A territory of the Dominion of Canada; bounded on the west by Alaska and stretching from British Columbia to the Arctic Ocean; constituted a separate political unit in 1898. Area, 207,076 square miles; population, according to the census of 1921, 4157. The chief towns are Dawson, the capital, and White Horse. Mining is the principal occupation, and the chief minerals are gold, copper, silver, lead, and coal. The output of gold in the year ended Mar. 31, 1925, was \$625,460. The revenue for 1924-25 was \$222,381, and the expenditure \$239,374. At the head of the government are a gold commissioner and a territorial council of three elected members. Acting gold commissioner in 1926, Percy Reid.

**ZANGWILL**, ISRAEL. Jewish author and dramatist, died in London, England, August 1. He was born in London, Feb. 14, 1864, the son of Moses Zangwill, a Russian refugee. He was practically self-educated, although as a boy he attended the Jews' Free School in the London East End, and later contrived to take a B.A. degree with triple honors, as an out-student of London University. He taught for a time at the Jews' Free School, and while so engaged he wrote (1888) with Louis Cowen, a farcical political romance called *The Premier and the Painter*.

He founded, in opposition to *Punch*, a maga-

zine called *Ariel* which did not survive long, and he turned his attention to satires and burlesques. One of his first works was *The Big Bow Mystery* (1892), a burlesque of the popular detective story. His novel, *Children of the Ghetto* (1892), marked his departure from purely humorous work. The success of this book led him on to others, but though greater success attended his novels, his plays predominated in the following years. His first dramatic work, *Six Persons*, (1892) was followed in 1899 by a dramatization of *Children of the Ghetto*, and two light plays, *Mercy Mary Ann* (1903) and *Jinny the Carrier* (1905). Described as "a moving plea for race fusion," *The Melting Pot* appeared in 1908, and *The War God*, produced in 1911, was a call for international amity and embodied a prophecy of the World War. Another prophetic drama written by Zangwill, *The Next Religion*, was banned in 1912 by the British censor. Zangwill devoted almost all his effort to the writing of plays, and there appeared in rapid succession *Plaster Saints* (1914), *Too Much Money* (1918), *The Cockpit* (1921), and *The Forcing House* (1922). His last dramatic work, *We Moderns* (1923), was not well received in England or in America.

In addition to fiction, Zangwill wrote studies of the work and lives of Heine, Lassalle, Spinoza and other thinkers. These studies, collected, were called *Dreamers of the Ghetto* (1898). In addition, he wrote poetry, and in 1923 translated Ibn Gabirol's poems from the Hebrew.

Zangwill was well known on the lecture platform in Great Britain, Ireland, Palestine, Holland and the United States. He was President of the International Jewish Territorial Organization, and although he had abandoned the Zionist movement in 1905 on the ground that it was impractical while Palestine was still in the hands of the Turk, he returned to the cause it represented in 1917, when it appeared that Palestine would soon be freed for the Jews. In October, 1923, however, he said his final word on the subject of "political Zionism" from the platform of Carnegie Hall in New York City. In spite of the fact that Zangwill's first successes were due to American appreciation, he was one of the most decided critics of the United States and especially of American Jewry. He was at one time president of the Playgoers' Club of London, and he remained an honorary member till the time of his death. He was also for some time president of the Jewish Historical Society of England, president of the Jewish Drama League, and a member of the Dramatists' Club.

**ZANZIBAR**. A British protectorate, consisting of the island of the same name off the coast of Tanganyika in east Africa, together with the island of Pemba and several other small islands. Area, Zanzibar, 640 square miles; Pemba, 380 square miles; population, according to the census of 1924, 216,790 (Zanzibar, 129,140; Pemba, 87,650). The total number of children attending schools in 1924 was 3405. The prevailing religion is Mohammedanism. Zanzibar, with a population in 1924 of 38,700, is one of the chief ports of Africa. The chief industry is the production of cloves, the two islands of Zanzibar and Pemba yielding the greater part of the world's supply. The exports in 1924 were 169,309 cwt., and clove-stems, 24,531 cwt. The coconut industry ranks next in importance to cloves; the export of copra amounted to 308,873 cwt. in 1924. The value of imports in 1924 was £1,976,230; of exports,

£2,031,770; revenue in 1925, £457,000; expenditures in 1925, £605,346; shipping entered in 1924, 930,628 gross tons. The nominal head of the government is the Sultan, but the actual administration is in the hands of a British resident, who is aided by an advisory council under the presidency of the Sultan. The Sultan's decrees are not binding unless countersigned by the British resident. Sultan in 1926, Seyyid Khalifa bin Harub; British resident, A. C. Hollis.

**ZINC.** The recoverable zinc contained in ore mined in the United States in 1926, according to the U. S. Bureau of Mines, was about 773,000 tons, as compared with 710,847 tons in 1925, a gain of 9 per cent. The output of the Eastern States was about 103,000 tons (78 per cent from New Jersey), of the Central States about 465,000 tons, and of the Western States about 205,000 tons. All important zinc-producing States in the West reported increased output as compared with 1925. The greatest gain was made in Utah, which showed an increase of 75 per cent. Idaho's gain was 68 per cent, and the Joplin district made a 4 per cent increase over its large output of 1925. The output of primary metallic zinc from domestic ores in 1926 was about 605,000 tons and that from foreign ores was about 7000 tons, a total of 612,000 tons, as compared with 555,631 tons from domestic ores and 17,315 tons from foreign ores, a total of 572,946 tons, in 1925. In addition to the output of primary zinc there was an output of about 42,000 tons of re-distilled secondary zinc, as compared with 39,181 tons in 1925, making a total supply of distilled and electrolytic zinc in 1926 of about 654,000 tons, composed of 190,000 tons of high grade and intermediate, 93,000 tons of select and brass special, and 371,000 tons of prime western zinc. Of the total output of primary zinc in 1926 about 131,000 tons was made in Oklahoma, 110,000 tons in Illinois, 102,000 tons in Pennsylvania, and 33,000 tons in Arkansas. The remainder was made in Indiana, Kansas, Montana, Texas, and West Virginia.

The total number of retorts at zinc smelters that operated during all or a part of the year was about 122,000. Of that number, about 89,000 were reported in operation at the end of November, and about 90,000 were expected to be in operation at the end of the year.

Figures published by the American Metal Market give an average quoted price of 7.35 cents a pound for prime western zinc at St. Louis in 1926, as compared with an average selling price for all grades in 1925 of 7.6 cents. At the opening of the year the quotation was 8.75 cents a pound and a quotation of 7.05 cents prevailed through most of December.

The production of the United States was practically one-half that of the world, which, at the end of the year, was estimated at 1,370,000 tons. Canada had increased its production from an average of 3200 tons per month in 1925 to over 5000 tons per month in 1926, while Belgium, which was the largest producer in Europe, was supplying over 18,000 tons per month, as against 16,000 tons in the previous year. Germany and Poland both increased their output, while the Australian production remained about the same as in the previous year. It was the largest source of zinc ore outside the United States, part of the ore being smelted in that continent and the remainder being shipped to Europe. An interest-

ing development was the taking over of mines and furnaces in Silesia by the Anaconda Copper Mining Company. England produced no zinc on account of the coal strike, but Italy and Mexico showed increased supplies.

**ZIONISM.** See JEWS.

**ZONING.** See CITY PLANNING.

**ZOOLOGY.** Zoölogical research in 1926 continued along both descriptive and experimental lines, with a preponderance of the latter. This is illustrated by the fact that of the papers read at the meeting of the American Society of Zoologists at Philadelphia, December 27-29, two-thirds were under the two headings Comparative Physiology, and Genetics.

In December appeared the first number of *Biological Abstracts*, a monthly publication giving abstracts of the world's literature in theoretical and applied biology.

**PROTOPLASM.** Although long ago identified as "the physical basis of life" and subjected to long-continued study, protoplasm remains more or less of a mystery so far as its *structure* is concerned. This was the subject of a symposium held at New Haven at the 1925-26 meeting of the American Society of Zoölogists. The papers read at that time appeared in *American Naturalist*, 60, p. 105 ff. Wilson stated that the alveolar formations found in protoplasm arise secondarily through the appearance and close crowding of dispersed formed bodies, and are of secondary importance in explaining protoplasmic structure. His general conclusion was that no universal formula can be given for this structure. Chambers, as a result of micro-dissection experiments, stated that there is considerable difference between different parts of the cell; in an amœba, for example, the outer portion is more solid and reacts to chemicals in a different fashion from the inner. Heilbrunn thought that experiments indicate that the interior of protoplasm is viscous, possibly composed of protein granules each with a surface film of lipid substance.

**EVOLUTION.** As was stated earlier (see YEAR BOOK for 1925) Bateson's confession of ignorance concerning the *methods* of the origin of species through evolution was interpreted by the anti-evolutionists as an abandonment of the evolution theory. Other workers, however, disagree with Bateson on this point, though admitting that much remains to be explained. Osborn (*Science*, 64, p. 337), stated that we have at least determined the *modes* of origin of species, though the *causes* are still obscure. Species, he said, arise either through mutation or through speciation, the former being of rare occurrence. Mutation means the sudden origin in one generation of a new species, due to a considerable germinal change. Speciation means a gradual change in species characters, leading first to sub-species and later to true species, the changes all being connected by inter-gradations. Changes of this sort might be interpreted as due to environment, and thus not permanent under other conditions. The deer mouse, *Peromyscus*, exhibits a distinct sub-species for each distinct climatic region on the western coast of America. This looks like climatic variation, but it has been shown that if removed to other localities the characters persist. Osborn interprets this to mean that varying potentialities exist in animals, and that these may be released in one or another direction by environmental conditions. When thus released,

the characters persist and are a step toward the production of a new species.

MUTATIONS. Mertens (*Zoöl. Anz.* 68, p. 323), concluded with regard to color mutations in amphibia and reptiles that: 1, they occur here as often as in other animals or plants; 2, regressive mutations, due to degeneration of pigment cells, occur more frequently than do progressive ones; 3, mutants are often dominant over original forms; 4, mutations are of especial importance for racial change if they occur in a race of limited distribution, as, e.g., on an island; 5, local forms or geographical races arise by mutations as well as by continuous variation.

SEXUAL SELECTION. Sexual selection, as a factor in the evolution of sex dimorphism in coloration of animals, has been of recent years generally discredited, the principal objection being that this dimorphism often occurs under conditions where, through inability of the animal to see the colors, they could have had no influence on its choice of a mate. Cinat-Thomson (*Biol. Zent.*, 46, p. 543) decided that in the case of the Australian grass parrakeet, *Melanopsittacus undulatus*, the female exerted a definite choice of a male; in some cases this choice was influenced by his coloration. Certain males were always chosen by different females when opportunity was given for comparison with other males, indicating a greater individual attractiveness shown by the one chosen. If a male that had not previously been a favorite was changed in appearance by artificially painting so as to intensify his normal colors, he would be a first choice; indicating selection on the basis of coloration. If a male were artificially colored with female tints, or a female with male tints, each would be courted by the opposite sex. As a rule, the female was not affected by the voices of different males, though she distinguished between them and the voices of females. When a female was separated by two opaque partitions on the one hand from a courting male and on the other from one who was carrying on his normal "conversation," she would go toward the former, indicating that the voice is employed in courtship. The general conclusion of the writer was that the male exhibiting the strongest secondary sexual characters would be the one first chosen by the female.

HEREDITY. The Sedgwick memorial lecture for 1926 was given at Woods Hole by Morgan with the title "Genetics and Physiology of Development." (*Am. Nat.*, 60, p. 489.) Referring to criticisms of the "gene" theory on the ground that locating all hereditary determiners in the chromosomes ignores the cytoplasm of the sex cell which must have some function in heredity, Morgan declared that the plastids of the plant cell are the only good examples of cytoplasmic inheritance. Reciprocal crosses may be made between two species and will give identical hybrids. If the cytoplasm is important in heredity the hybrid in each case should resemble the female parent and thus be different in reciprocal crosses. Morgan thought that genetically the cytoplasm may be ignored. One contribution of genetics to the solution of the physiology of development has been the demonstration of the importance of using homozygous material, another was in furnishing the explanation of hybrid vigor. Genes are probably not enzymes but protein bodies able to produce enzymes which are

thrown into the cytoplasm and take part there in catalytic reactions. Morgan declared that the experimental study of fundamental problems of physiology had almost come to a standstill when two new methods appeared—one the application of physico-chemical technique to the study of living organism, the other the application of genetics to these problems.

It is generally believed that the chromosomes of the sex cell are the carriers of the determiners of heredity and the "X" chromosome is one about which a good deal of research has centred. Associated with the "X" chromosome is the "Y," with which it has not been in general possible to associate any particular determiner or "gene." Although Castle (see YEAR BOOK for 1921) thought that it carries the determiner for a color marking in a South American fish, *Lebistes*, it is generally regarded as "empty." Stern, (*Biol. Zent.*, 46, pp. 349 and 505) basing his conclusions on phenomena resulting from the non-disjunction of the "X" and the "Y" in spermatogenesis in the fruit fly, thought that the "Y" in this case contains an allelomorph for the gene which determines "bobbed" or short-bristle condition.

ORGANIC INDIVIDUALITY. Issajew (*Russ. Archiv.*, 108, p. 1), bases a discussion of the problem of individuality on the results of experiments on two species of hydra, *H. oligactis* (*fusca*) and *H. vulgaris*. Homoplastic (where the animals are all of the same species) and heteroplastic (where they are of different species) grafting and fusions were made, the former being much the more satisfactory. If two animals are split lengthwise, flattened out and held together for a time, they will fuse, and a form with double the regular number of tentacles results. This gradually rounds up into the hydra form, and later, through fusion, the tentacle number is reduced to the normal. The individualities of two animals are now merged into that of one. What has become of the two? Hydrazes were chopped into small pieces, and the pieces were put together in a heap. The ectoderm and entoderm cells gradually separated from one another and by cytotropism collected into homogeneous layers, and several new hydrazes, forming a regular colony, appeared from the mass. What has become of the individualities of the original hydrazes? The author argues finally that these results indicate that in hydra where there are reserve "I cells" scattered all through the body, each of these cells being totipotent and able to give rise to a new animal, there is no true individuality. He makes two classes: 1, indivisible individual beings; and 2, divisible "dividual" beings. To this second class belong plants, sponges, hydroids, some worms, ascidians, and the early stages of the developing eggs of many metazoa. This dividuality prevents any separation of soma and germ plasma, any differentiation of the sex cells, and results in the lack of sex dimorphism during the vegetative phase of the life cycle. With this condition, organic individuality is impossible. Such an individuality arises hand in hand with the appearance of a definite germ path, early separation of the sex cells, and the development of sex dimorphism. The dividual is potentially immortal, natural death arising with the separation of soma from germ cells. Issajew comments on the bearing of this work on the rival doctrines of vitalism and mechanism. In its older sense,

with its entelechies, etc., he considers vitalism to be outgrown, but it still is valid as a working hypothesis used in attempting to explain the new problems which follow upon the extension of knowledge. Similarly, mechanism has its place as an hypothesis. What is necessary in future is to secure a body of facts that will give a basis for speculation much more definite than any we now have.

**DEATH.** Lepeschkin (*Biol. Zent.*, 46, p. 480), discussed the physico-chemical origin of death. Life, he said, is possible only in colloidal material, where the diffusion processes are comparatively slow. Anything which causes this colloidal material to be irreversibly destroyed not only destroys all life but all possibility of life. If there occurs a coagulation of the dispersal phase while the "dispersional mittel" remains, life may persist. If both phases coagulate, death follows. These coagulation changes may be called out by a variety of agents. Death from old age is due to the coagulation of this "dispersional mittel."

**LUMINESCENCE.** A popular account of Beebe's *Arcturus* expedition (see YEAR BOOK for 1925) appeared under the title, *The Arcturus Adventure*. Beebe records in this some observations on luminescence in the slender-tailed lantern fish *Myctophum coccoi*, a very small fish, weighing when adult about a gram. On either side of the body are 32 ventral lights; there are 12 lateral lights along the head and body, and from 4 to 8 median on either side above or below the tail. From the lower battery a solid sheet of light is cast downward, and Beebe noted that copepods would swim into this light as if attracted by it. The fish would then twist down and catch the copepod. Beebe thought that the lateral lights might be recognition marks. The caudal lights in the male are on the dorsal, those in the female on the ventral surface. These are possibly sex recognition marks, though their effect on the human eye points to a possible protective function. The flash has a blinding effect, so that for a time, just after it is turned off, the eye is unable to see the fish. If its natural enemies are similarly affected, the organ must have a decided protective value.

**MIGRATIONS.** Thompson, in *Problems of Bird Migration*, discussed in an early chapter the general question of migration in animals, limiting the term to cases where the animal regularly returns to the original locality after the migration. This would exclude such phenomena as the movement of lemmings, an activity which might be better characterized as swarming. The major part of the book is, however, concerned with bird migration, which is discussed from various angles, particularly with reference to conditions in the British Isles. Banding, because it has made possible the following of the wanderings of individual birds, has given most valuable information. It happens sometimes that what looks like a condition of permanent residence is really a case where the same locality is inhabited at different seasons by different individuals of the same species, which regularly migrate to other localities. If individuals are banded, this limited migration can be recognized. Thompson pointed out that migration is an expensive custom, which must be supposed to serve some useful end, probably in that it enables the bird to occupy two different regions in the season most favorable for it, especially in connection with food and breed-

ing places. Most theories of the origin of this habit refer it to some compelling cause in the past history of birds which is not now operative but which impressed the habit on the race. It is, however, possible that it may have arisen more suddenly, Pallas' sand grouse is cited as an example. (This species sometimes shows a definite spring migration, followed by a less evident fall one, from Central Asia to a region as far distant as northwestern Europe.) As far as the individual is now concerned, migration is an inherited custom which is awakened semi-annually by causes both external and internal. The details of the process are too complicated to admit of any simple explanation. Migrations of butterflies are of common occurrence, but have been thought by some to be mostly a mechanical movement due to air currents. Cramer (*Nature*, 118, p. 191) described a migration of painted lady butterflies at Palo Alto, Calif., in the early spring of 1926, where for two days immense numbers of these insects flew from southeast to northwest at a rate of about 15 miles per hour against the wind. Cramer offered no explanation of this movement.

**PROTOZOA.** Schaeffer (*Carnegie Inst. Pub.*, No. 345) discussed the taxonomy of the amœbas and gave a description of thirty-nine new species. In animals with so little external morphological characters as are shown in this group, it is difficult to determine precise taxonomic criteria, but Schaeffer believed that both nuclear and cytoplasmic characters appear to the experienced observer to be as definite and certain as they are in any other animal group. The most important information concerning a species is derived from pedigree cultures, and Schaeffer obtained these in the case of most species. While the taxonomy of the common amœba is very much confused, it appears that the application of the laws of priority require us to put it in the genus *Chaos* (Linnaeus 1767) and species *diffuens* (Muller 1788). In this case, "amœba" would disappear as a generic name but may conveniently be retained as a popular term to apply to any member of the group.

An important book of the year was Calkins' *Biology of the Protozoa*, in which were discussed the morphology, the taxonomy and the physiology of this phylum. An important problem in the protozoa is whether conjugation is essential for continued life of a race, or whether, if environmental conditions are favorable, it might live indefinitely in the absence of conjugation or its equivalent endomixis. (See YEAR BOOKS for 1914, 1916 and 1917.) While the evidence is somewhat confusing, Calkins argued for the former position. For example, a pure culture of *Uroleptus* in which conjugation is prevented lives only from ten months to a year, while if two individuals are taken from this series and allowed to conjugate they will start a new line whose life overlaps that of the parents, even though they have received identical food. Conjugation in some way has renewed the racial vitality. On the other hand, Dawson (*Jour. Exp. Zool.*, 46, p. 345) found that in a hypotrichous ciliate, *Histrio complanatus*, the cultures died only under conditions which he interpreted as due to unfavorable environment. Beers (*Jour. Morph. and Phys.*, 42, p. 1), reared *Didinium* in two series. To one was given an abundance of food, while the other received an insufficient amount. The

former showed no indication of reduced vitality and senescence, while the latter did. Beers concluded from these results that the pure line might continue indefinitely if provided with favorable food and environment.

Mast (*Jour. Morph. and Phys.*, 41, p. 347) recorded observations on the structure and locomotion of *Amoeba proteus*. The central portion of the animal is made up of an elongated fluid portion, the plasmasol, which is surrounded by a more rigid portion, the plasmagel. Outside this is a hyaline layer which may be liquid (as at the tip of pseudopods), and on the very outside an extremely thin layer, the plasmalemma. A local liquefaction of the gel is the starting point of a pseudopodium. The decrease in elastic strength resulting from this liquefaction produces a protuberance, and contraction at the posterior end forces out the plasmasol to form a pseudopodium. During locomotion the gel is changed to sol at the tip of the pseudopods, while at the posterior end the sol changes to gel. The character of the movement depends on whether the plasmalemma is attached to the sub-stratum or is free.

Ivanič (*Zoöl. Anz.* 68, p. 1) described the process of encystment in *Paramacium*, a very rare occurrence in this protozoön. The author had a culture of various protozoa and other microscopic forms, in which *Paramacium* appeared in remarkably small numbers, never forming a mass culture. This probably indicated a depression condition which was also responsible for the appearance of encystment. In this process the animals first became oval and then rounded up into a sphere which was covered by a slimy layer, probably ectocyst. The cilia had fallen off in the meantime. The outer layer of the body then became an endocyst. The tricoecysts gradually disappeared by absorption into the protoplasm. The cytostome at first becomes larger but later disappears. Since food may be in the body at this time, encystment is not a result of starvation. The author thought it depends on a period of nuclear depression, though the nuclear changes which take place here are much less than those at ordinary divisions. More serious depression conditions are remedied by parthenogenesis or conjugation. Bozler (*Proc. German Zool. Soc.*, 1926, p. 124) stated that the geotaxis of *Paramacium* is affected by temperature, being positive at lower and negative at higher temperature levels, though there is some individual variability. If enclosed in a glass tube so that geotaxis brings about contact with the glass, there is a decided negative thigmotaxis, causing a rebound from the wall like that of a rubber ball.

SPONGES. The siliceous spicules of sponges have long been used for taxonomic purposes, because they persist from generation to generation in essentially constant form and were regarded as the most characteristic of sponge characters. Dendy, an English authority on sponges, has maintained that they are really manufactured by bacteria living symbiotically in the sponge tissue. A posthumous paper by Dendy (*Quart. Jour. Mic. Sci.*, 70, p. 1) gives this argument in much detail, supporting it by numerous descriptions of the structure of these spicules and of their mode of origin. It apparently has often happened in the evolution of the sponges that one type of spicule has dropped out. This has been explained

on the assumption that a mendelian factor has been lost from the germ plasm. Dendy explained it rather as due to the failure of infection by the appropriate microorganism. Since the infection is generally quite constant and the characteristic form of spicule persists from generation to generation, Dendy saw no reason for abandoning spicules as taxonomic features.

HYDROZOA. Scheider (*Zoöl. Anz.*, p. 314), described some habits and modes of feeding in *Protohydra*. The animal is very adaptable to changed environmental conditions, and it is not easy to see how it could ever be exterminated in any locality, especially as it is very highly resistant to extremes of temperature and to chemical changes. It lives mainly on nematodes and insect larvæ, and will take food readily from forceps if the food is kept in movement. Two animals were seen to attempt to swallow the same nematode, with the final result that the larger swallowed both the nematode and the smaller hydra. The hydra ordinarily feeds on small crustacea, but Hyman (*Trans. Am. Mic. Soc.*, 45, p. 298) recorded a case where hydras were attacked and killed by large numbers of a small cladoceran *Anchistropus minor* which attached themselves to the hydras. Ordinarily, such crustacea would be killed by the nematocysts of the hydra, but these were not, being either immune to nematocyst poison or not attacked by the hydra. Hyman suggested that since hydras are sometimes injurious to fish in hatcheries, the introduction of these crustacea might offer a remedy.

ANNELIDS. Although it has been known for a long time that the common earthworm, *Lumbricus terrestris*, is sensitive to light, little information was available concerning the sense organs involved. Hess (*Jour. Morph. and Physiology*, 41, p. 63) described in detail the structure of "licht-zellen," as these were earlier named by Hesse. They consist of large cells, each with a central lens surrounded by a network of nerve fibres. The lens was found to focus light rays on to the nerve fibres irrespective of the direction of the rays. Pinhole windows in a sub-epidermal pigment layer admit light from all directions to these lenses. These photo-receptors are found in the epidermis in all parts of the body except intersegmentally and on the ventral surface.

CRUSTACEA. Caullery (*Bull. Biol. de France et Belge*, 60, p. 126) described a crustacean, *Capprella*, which very perfectly mimics a colonial bryozoön in both color and form, so that when quiescent it could not be seen. Caullery thought that this does not in any way protect the animal but results from visual reflexes. Dembowska (*Biol. Bull.*, 50, p. 163) described the behavior of *Dromia*, a crab which usually carries a sponge held over its back by the especially modified fourth and fifth pairs of legs. Dembowska was unable to find any evidence that this is beneficial to the sponge, hence concluded that it is not a case of symbiosis. There is no definite specificity involved in the choice of the sponge, as the crab will take any it can find. In the absence of sponges, the crab will utilize any other material. If given a piece of paper, it will cut out an oval portion of just the right size, and in procuring a sponge it cuts the sponge away from its foundation or will tear away little bits, in either case getting eventually an oval piece of the proper size to fit its own shell. By a com-

plicated process which varies with the conditions, the sponge is pushed into the final position. The crab shows considerable discriminatory powers in selecting the object it will use, preferring sponges to anything else. There is evidence of associative memory as, e.g., if the covering be taken off and put in a group with others, the crab will choose the one it had before. It will also learn to go to a certain part of the aquarium if the cover has repeatedly been taken off and put in that place, even though it were not there at the time. Dembowska (*Biol. Bull.*, 50, p. 179), described some habits of a fiddler crab, *Uca*, especially with reference to burrowing. The author strongly emphasized the conclusion that in this there is the greatest plasticity of activities and nothing stereotyped and tropistic. The burrow always has an end chamber which acts as an air chamber during high tides, the opening to the burrow being closed with sand by the crab as the tide comes in. While the hermit crab is a water-breathing animal, its gill chamber contains water which enables it to live in the air for several weeks at a time.

**ARACHNIDS.** Wood (*Jour. Morph. and Physiol.*, 42, p. 143) discovered that, contrary to the usual belief, spiders do not have the power of autotomy. A spider will remove an injured limb by biting it off, but there is no automatic or reflex mechanism concerned, as is the case in crustaceans. Pavlovsky (*Quar. Jour. Mic. Sci.*, 70, p. 135), discussed at length the lungs of scorpions. His final conclusions were that these are so perfectly adapted to various environmental conditions that they have been only very slightly modified from former times. In this respect scorpions may be regarded as the most ancient arachnids.

**INSECTS.** Lutz (*Nat. Hist.*, 26, p. 206) discussed the meaning of insect sounds, and concluded that many of these are accidental or incidental to various activities of the animal and are not of any more significance than the rattling of the armor of an ancient knight was to him. Lutz stated that when studying crickets he was able to distinguish the sound made by males according as they were fighting, courting or merely "singing," but that he could not see that these noises in any way affected the behavior of the female. Thus, it remains an open question whether the insect really hears the noise itself makes.

**MOLLUSCA.** Grimpe (*Proc. Germ. Zool. Soc.*, p. 148), described the process of mating in *Sepia officinalis*. If mature males and females are brought together they will begin at once to pair. At this time the coloring becomes more intense. This pairing is dependent on temperature, and apparently does not occur at low temperatures. The spermatophores are passed into the bursa copulatrix usually by the left arm. The process of egg laying is much like that of *Loligo* as described by Drew. When laid, the eggs are attached to corals, etc., or to twigs. The female finds her way to these twigs by sight, for if chemical stimuli are excluded by covering them with glass she will still go to them.

**FISHES.** One result of the *Aroturus* expedition (see YEAR BOOK for 1925), was the securing of material for the study of the embryology of a large number of fishes whose life history was previously unknown. In February, March and May these stages were particularly numerous in the Atlantic from Bermuda south, being much

more abundant there than from March to June in the Pacific. The appendix to the report of the United States commissioner of fisheries for 1926, published as *Bureau of Fisheries Document No. 1003*, stated that 161 species had been studied; among these were the eggs and young of 5 species of flying fish, some of them collected from nests in the Sargassum. In a later note, Mrs. Fish (*Science*, 64, p. 455) gave in detail observations on the development of some eggs provisionally identified as belonging to the common eel, *Anguilla rostrata*. If this identification is correct, it completes our knowledge of the life history of the eel. (See YEAR BOOK for 1923.)

**BIRDS.** As stated under *Migrations*, banding of birds enables us to secure valuable information, concerning migrations, obtainable in no other way. This work in the United States was at first done by voluntary associations, but it has now been taken over by the Biological Survey. Lincoln (*Auk*, 43, p. 153) reported on the results of this work. In addition to providing data for a study of migrations, important observations have been made on the change of plumage as the animal grows older. Gardner (*Auk*, 43, p. 447) described investigations of methods of protection of almond and apricot orchards in the State of Washington from attacks by crows. Flocks of crows, estimated to contain 30,000 individuals, completely ruined these crops. The most satisfactory remedy proved to be to spread poisoned almonds between the rows of trees. Although only about 1 per cent of the birds were actually poisoned, their behavior under the influence of the poison was sufficient to alarm the remainder of the flock, and they did not return, thus illustrating the extreme sagacity of these animals.

**MAMMALS.** Bauman (*Jour. Mammalogy*, 7, p. 1) compared the strength of pull, as recorded on a dynamometer, of a chimpanzee and of man, using for the latter members of a college football team who had spent the previous summer at work on farms in order to keep in muscular training. The results indicated that after the necessary corrections for relative weight had been made, the chimpanzee was from 2:57 to 4:78 stronger than the various men who were tested. Bauman was unable to account for this difference in any structural feature of the muscles in the two cases. He called attention, however, to a possible fallacy in the common belief that strong muscles are always associated with considerable roughnesses on the bones. The bones of the chimpanzee do not show enough such roughnesses as compared with man, to correlate in any way with these differences in absolute strength.

Bats have been thought to feed largely on mosquitoes, and this led to the construction in certain parts of Texas of "bat towers," wooden structures affording shelter to large numbers of bats. Storer (*Jour. Mammalogy*, 7, p. 85) was unable to find in the droppings of the bats which accumulate in considerable amounts at the bases of these towers any indication of mosquito remains, as would be the case if they had been eaten by the bats. His conclusion was that there is no reason to think that bats eat mosquitoes to any appreciable extent. They feed largely on moths, and this has undoubted economic importance, as has the considerable guano accumulation in the towers, but as enemies of mosquitoes they may be ignored. Shaw (*Jour. Mammalogy*, 7, p. 91), recorded observations on the

underground hibernating dens of the Columbian ground squirrel. These are usually dug at an angle with the surface, and are provided with drainage tunnels. Those made by the squirrels of the first year are not so well made as those of older animals, showing improvement through practice.

Schultz (*Am. Nat.*, 60, p. 297) reported that at all stages of development the human body shows great variations independent of environ-

mental conditions. These variations have a definite evolutionary significance.

**ZULULAND**, zoō'loo-land. A portion of the province of Natal in the Union of South Africa, to which it was annexed Dec. 30, 1897. Area, 10,427 square miles; population, in 1911, 219,606. There are extensive sugar plantations, the output of which, in 1923-24, was 203,300 tons. See SOUTH AFRICA, UNION OF, for the statistics on Natal.
